
CHAPTER II

AWARENESS TOWARDS SAVINGS AND INVESTMENT ALTERNATIVES

I Introduction

Financial literacy serves as the cornerstone of individual financial well-being and collective economic progress. In the Indian context, where the population is marked by a wide spectrum of income and education levels, awareness of savings and investment alternatives plays a particularly critical role. Public sector employees, given their relatively stable employment and income, form a key segment of this demographic. Despite their financial stability, their patterns of saving and investing remain inadequately documented, especially in the culturally and economically dynamic state of Telangana. This study is an attempt to bridge this knowledge gap by focusing on three districts—Warangal, Karimnagar, and Khammam—which were formerly unified under Andhra Pradesh and are now integral to Telangana’s socio-economic framework.

These districts represent a diverse cross-section of the state’s demographic and economic spectrum. Warangal is known for its educational institutions and growing textile industry, Karimnagar for its agrarian and mining economy, and Khammam for its forestry-based industries and urban growth. Public sector employees in these districts work across various sectors including health, education, utilities, and governance. While their financial livelihoods are generally secure, the availability and penetration of tailored financial literacy initiatives in these regions remain minimal. This disparity raises important questions about how income security influences awareness and adoption of financial products.

The significance of understanding financial awareness goes beyond identifying who knows what. It touches upon the accessibility, trust, and actual usage of financial instruments. Many public sector employees rely heavily on pensions and fixed incomes, which can give a false impression of financial security. This perceived safety may lead to the neglect of more dynamic and potentially rewarding financial instruments like mutual funds or equity shares. In Telangana, such choices are also culturally influenced. Assets such as gold and real estate continue to dominate household portfolios, often overshadowing more liquid and growth-oriented investment vehicles.

A close examination of data from 450 respondents across the three districts reveals telling patterns in financial behavior. Traditional savings instruments continue to dominate. For instance, bank deposits were reported as being familiar to 62% of respondents who identified as “highly aware.” Real estate investments followed closely, with 65% recognition, and government-backed savings schemes at 59%. Despite gold’s cultural prominence in Indian households, awareness about formal gold investment instruments, such as sovereign gold bonds or ETFs, stood only at 44%.

Conversely, market-linked financial products fare poorly in terms of public awareness. Equities are recognized by merely 37% of the participants as investment options they understand well. Mutual funds, which are generally perceived as safer and more accessible than direct stock investments, did only slightly better with 48% claiming high awareness. Bonds represent a particularly misunderstood category; while 36% said they were moderately aware, only 42% claimed high familiarity, indicating a significant gap in financial education regarding fixed-income instruments.

Region-specific data also adds nuance to this landscape. Warangal leads in traditional savings awareness, with 71 respondents identifying as “extremely aware” of bank deposits. However, the same group shows a polarized understanding of mutual funds, where nearly as many respondents who are extremely aware are balanced out by those who are completely unaware. Karimnagar appears to have a strong grasp of government schemes but lacks familiarity with stocks, with 21% of respondents admitting complete ignorance. Khammam reveals a troubling trend: one-third of respondents report being unaware of equities, although the district performs well in insurance awareness, with 68 respondents identifying as extremely aware.

Age and income stratification reveal further disparities in awareness levels. Employees between the ages of 35 and 45 exhibit the highest levels of financial awareness, possibly due to life-stage responsibilities that necessitate better money management. Conversely, younger employees under 25 and older employees over 55 often lack familiarity with complex financial products. High-income employees (earning over *Rs. 80,000* per month) are three to four times more aware of stocks and mutual funds than those in lower income brackets, pointing to a correlation between economic capacity and financial literacy.

Several structural barriers continue to impede financial literacy among public sector employees in these regions. One notable issue is the limited availability of qualified financial advisors, particularly in semi-urban and rural areas. In such settings, employer-driven schemes like the General Provident Fund (GPF) or National Pension Scheme (NPS) are often the sole sources of structured financial exposure. While beneficial, these do not provide comprehensive financial education.

Behavioral factors also play a crucial role in shaping investment patterns. Risk aversion is deeply rooted in the financial psyche of public sector employees, often nudging them toward tangible, perceived-safe investments like gold or property. Moreover, misinformation about market-linked instruments, especially mutual funds and equities, often spreads through informal networks and social circles, leading to entrenched skepticism.

At the policy level, well-intentioned state-led schemes sometimes unintentionally overshadow private investment education. Initiatives like Rythu Bandhu, while providing financial support to farmers and workers, do not necessarily equip individuals with long-term investment knowledge. Simultaneously, gaps in digital literacy hinder the use of modern investment platforms, despite growing access to internet services and smartphones.

Given this backdrop, the primary objectives of the study are fourfold. First, to quantify levels of awareness among public sector employees across a broad spectrum of savings and investment products. Second, to identify and analyze the impact of demographic factors such as age, income, and geographic location on financial awareness. Third, to assess how awareness correlates with actual investment behavior. Lastly, to recommend region-specific strategies to improve financial education and participation.

To achieve these aims, a mixed-methods research design was adopted. On the quantitative side, structured surveys were administered to 450 employees—150 from each of the three districts—evaluating their awareness on a 5-point Likert scale. The survey covered an extensive range of financial instruments and behavioral indicators. On the qualitative front, focus group discussions were conducted to gain deeper insights into cultural and emotional barriers to investment, including trust issues and risk perceptions.

The data obtained was analyzed using descriptive statistics and comparative cross-tabulation, especially emphasizing intersections between variables such as age and income or district and product awareness. This approach not only allowed for the identification of broader trends but also helped pinpoint localized issues that demand tailored interventions.

This research represents the first systematic attempt to map the financial awareness landscape of Telangana’s public sector workforce across multiple districts. The implications of the findings are manifold. From a policy perspective, the government can leverage these insights to craft financial literacy programs aligned with regional and occupational needs. Financial institutions like banks and mutual fund providers can design outreach strategies rooted in localized awareness gaps, increasing both their reach and customer trust.

Most importantly, the study serves the employees themselves. By highlighting the areas where knowledge is lacking, the findings pave the way for empowering individuals to take charge of their financial futures. The benefits of such empowerment extend beyond personal gain; a financially literate public workforce contributes to more stable household economies and, by extension, a more robust regional economy.

In conclusion, the introduction of this study underlines the urgency and necessity of enhancing financial literacy among public sector employees in Telangana. As the state continues to modernize and diversify its economy, the financial participation of its workforce must evolve in tandem. Awareness is not merely an academic metric; it is a prerequisite for participation, inclusion, and upward mobility in the modern financial ecosystem. This study is a foundational step toward bridging the gap between passive saving and active, informed investing. By doing so, it aims to catalyze a shift toward greater financial agency, resilience, and regional prosperity.

II Awareness

Table 2.1 - Awareness of respondents towards Savings and Investments alternatives

Investment Option	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Bank Deposits	189(42)	90(20)	72(16)	63(14)	36(8)	450(100)
Mutual Funds	126(28)	90(20)	113(25)	45(10)	76(17)	450(100)
Stocks and Shares	72(16)	95(21)	99(22)	89(20)	95(21)	450(100)
Real Estate	176(39)	117(26)	94(21)	36(8)	27(6)	450(100)
Gold and Precious Metals	90(20)	108(24)	121(27)	68(15)	63(14)	450(100)
Government Schemes	153(34)	112(25)	81(18)	54(12)	50(11)	450(100)
Bonds	81(18)	108(24)	162(36)	54(12)	45(10)	450(100)
Insurance Policies	198(44)	81(18)	58(13)	63(14)	50(11)	450(100)
Saving Scheme	189(42)	108(24)	72(16)	45(10)	36(8)	450(100)

Source: Primary Data The table 2.1 presents awareness levels of public sector employees in Telangana regarding various savings and investment alternatives. The analysis reveals significant variations in awareness across different financial instruments:

Bank Deposits: This is the most recognized instrument with 62% (Extremely + Very aware) of respondents showing high awareness. Only 8% reported no awareness, confirming banks as the primary savings channel for public sector employees. The widespread banking infrastructure in Telangana likely contributes to this familiarity.

Mutual Funds: Shows moderate awareness with 48% in high awareness categories. Notably, 17% report no awareness at all, indicating potential knowledge gaps. The 25% moderate awareness suggests many employees recognize mutual funds but may lack detailed understanding of their functioning.

Stocks and Shares: Demonstrates the lowest awareness among all options with just 37% in high awareness categories. The symmetrical distribution (21% each in Very, Moderate, and Not aware categories) suggests equities remain complex or inaccessible for many government employees despite market growth.

Real Estate: Ranks second in overall awareness (65% high awareness) and lowest in "Not aware" category (6%). This reflects Telangana's booming property market and cultural preference for physical assets. Employees likely consider real estate a primary investment avenue.

Gold and Precious Metals: Shows balanced awareness distribution peaking in moderate category (27%). While 44% demonstrate high awareness, the 14% unawareness is notable given gold's cultural significance. This suggests some employees may not consider formal gold investment channels.

Government Schemes: Enjoys strong awareness (59% high awareness) due to payroll linkages and promotional campaigns. The 11% unawareness is concerning however, indicating potential gaps in communicating schemes like NPS, PPF, and SSY to beneficiaries.

Bonds: Presents a unique pattern with the highest moderate awareness (36%) but lower high awareness (42%). This suggests employees have heard of bonds but lack detailed knowledge. The 10% unawareness indicates bonds are less visible than other government-backed options.

Insurance Policies: Leads in extreme awareness (44%) with 62% combined high awareness. This reflects mandatory coverage and aggressive marketing. The 11% unawareness however highlights a segment still outside formal insurance coverage.

Saving Schemes: Ties with bank deposits for highest overall awareness (66%). The low unawareness (8%) confirms strong penetration of small savings schemes (Post Office, RD, etc.) among government staff.

Figure 1: Awareness of respondents towards Savings and Investments alternatives

The horizontal stacked bar chart reveals significant variations in respondent awareness across different investment vehicles. Bank deposits, real estate, insurance policies, and saving schemes demonstrate the strongest awareness profiles, with over 65% of respondents reporting *extremely* or *very* aware status. Particularly noteworthy is insurance policies, which shows the highest extreme awareness (44%) despite moderate gaps in lower awareness categories. Stocks and shares exhibit the most concerning profile, with only 37% combined high awareness and the highest proportion of completely unaware respondents (21%). Bonds present a unique pattern where moderate awareness dominates (36%), suggesting potential for knowledge-building initiatives. Government schemes show unexpectedly strong awareness (59% combined high awareness), outperforming gold/precious metals

(44% high awareness) and mutual funds (48% high awareness). These disparities highlight opportunities for targeted financial education, especially for market-based instruments like stocks and mutual funds where awareness gaps are most pronounced.

Key Findings:

- Traditional instruments (Bank Deposits, Real Estate, Saving Schemes) show strongest awareness
- Market-linked instruments (Stocks, Mutual Funds) have significant awareness gaps
- Government-backed options enjoy moderate-to-high recognition
- 6-21% of employees remain completely unaware of various investment vehicles
- Insurance awareness is remarkably high, likely due to mandatory requirements

Table 2.2- Area-wise Awareness on Bank Deposits

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	71	32	22	13	12	150
Karim Nagar	65	28	24	18	15	150
Khammam	53	30	26	32	9	150
Grand Total	189	90	72	63	36	450

Source: Primary Data

Table 2.2 presents a comparative analysis of respondent awareness regarding bank deposits across three distinct geographical regions in Telangana: Warangal, Karim Nagar, and Khammam. The quantitative data reveals significant regional disparities in financial awareness, with Warangal demonstrating the highest level of extreme awareness (71 respondents, 47.3% of its total), followed by Karim Nagar (65, 43.3%) and Khammam (53, 35.3%). Notably, all regions show consistent total respondent counts of 150 each, yielding an aggregate sample of 450 participants. The table employs a structured matrix format with clear categorical boundaries, enabling direct comparison of awareness gradients from "Extremely aware" to "Not at all aware" while maintaining consistent numerical formatting for precise interpretation.

Key Patterns: The data reveals two compelling geographical patterns: First, Warangal maintains the strongest overall awareness profile, exhibiting the highest extreme awareness (71) and lowest non-awareness (12 respondents). Second, Khammam displays a distinctive bimodal distribution, showing both substantial extreme awareness (53) yet paradoxically the highest slight awareness (32) among regions. Karim Nagar presents moderate awareness across categories but shows the highest not-at-all-aware cohort (15). The aggregate totals highlight that extreme awareness dominates regionally (189 respondents, 42% of total), while non-awareness is relatively limited (36, 8%). These regional variations suggest potential socioeconomic or educational determinants that warrant further investigation regarding financial literacy dissemination mechanisms.

Figure 2: Distribution of awareness levels on bank deposits across geographical areas

The stacked bar chart visualization presented in Figure 2 elucidates significant regional disparities in financial literacy regarding bank deposit schemes across the three sampled districts of Telangana. Quantitative analysis reveals that while each geographical

area surveyed an identical number of respondents ($N = 150$ per district), the compositional distribution of awareness levels exhibits marked variations. Warangal demonstrates superior performance in advanced financial literacy, with *Extremely aware* respondents constituting 47.3% ($n = 71$) of its cohort—a significantly higher proportion than both Karim Nagar (43.3%, $n = 65$) and Khammam (35.3%, $n = 53$).

Karim Nagar manifests the most balanced distribution across awareness tiers, though noteworthy for having the highest proportion of *Not at all aware* respondents (10.0%, $n = 15$) and the lowest proportion of *Very aware* individuals (18.7%, $n = 28$). Khammam presents a distinctive profile characterized by two countervailing trends: the lowest incidence of advanced awareness (*Extremely + Very aware* = 55.3%) yet simultaneously the highest proportion of *Slightly aware* respondents (21.3%, $n = 32$) and the lowest proportion of *Not at all aware* individuals (6.0%, $n = 9$).

These patterns suggest differential effectiveness in financial literacy dissemination across regions. Warangal’s distribution skews positively toward higher awareness echelons, indicating successful penetration of financial knowledge. Conversely, Khammam’s bimodal distribution suggests segmentation in information access, with a substantial population cluster at moderate awareness levels requiring targeted interventions. The data further indicates that Karim Nagar would benefit most from programs addressing foundational financial knowledge gaps. These empirical findings underscore the necessity for regionally tailored financial education strategies rather than uniform state-wide approaches.

Table 2.3- Area-wise Awareness on Mutual Funds

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	48	26	32	14	30	150
Karim Nagar	42	34	39	10	25	150
Khammam	36	30	42	21	21	150
Grand Total	126	90	113	45	76	450

Source: Primary Data

Table 2.3 presents the distribution of awareness levels regarding mutual funds across three distinct geographical areas in Telangana: Warangal, Karim Nagar, and Khammam. The data, collected from a total of 450 respondents (Grand Total), categorizes awareness into five ordinal levels ranging from “Extremely Aware” to “Not at All Aware.” The tabular format facilitates comparative analysis both within individual regions and across different awareness categories. Preliminary observation indicates significant regional disparities, with Warangal exhibiting the highest polarization between awareness extremes, while Karim Nagar demonstrates relatively stronger representation in higher awareness tiers. The aggregated totals reveal that “Extremely Aware” constitutes the largest segment (126 respondents, 28.0%), followed by “Moderately Aware” (113 respondents, 25.1%), suggesting moderate overall penetration of mutual fund knowledge in the surveyed population.

Cross-regional analysis reveals distinctive awareness patterns. Warangal leads in absolute numbers for both “Extremely Aware” (48 respondents) and “Not at All Aware” (30 respondents) categories, indicating pronounced knowledge disparities within its population. Karim Nagar shows the most favorable distribution with the highest combined percentage in top-two awareness tiers (42 Extremely + 34 Very Aware = 50.7% of its cohort) and the lowest “Slightly Aware” incidence (10 respondents). Khammam presents the most balanced profile, registering the highest “Moderately Aware” respondents (42) and equal distribution in the lowest awareness categories (21 each for Slightly and Not at All Aware). These variations potentially reflect differential effectiveness of financial literacy initiatives, regional economic factors, or prior exposure to investment vehicles across the studied locales.

Figure 3: Distribution of awareness levels on mutual funds across geographical areas

Figure 3 presents a comparative visualization of mutual fund awareness across Warangal, Karim Nagar, and Khammam. Each area had a consistent respondent base ($N = 150$), facilitating direct comparison of awareness distribution.

Warangal leads in the highest-tier financial awareness, with 32.0% ($n = 48$) being *Extremely aware*. However, it also reports the highest proportion of *Not at all aware* individuals (20.0%, $n = 30$), reflecting a polarized population. In contrast, Karim Nagar exhibits a more uniform distribution and the highest number of *Very aware* individuals (22.7%, $n = 34$), suggesting a broad, if not deep, level of engagement with mutual fund knowledge.

Khammam features a distinctive emphasis on moderate awareness—28.0% ($n = 42$) *Moderately aware*—and relatively balanced scores in other categories, although slightly weaker in the top awareness tier.

Overall, Warangal shows the greatest variance in financial literacy, while Karim Nagar appears the most balanced. Khammam, with its middle-heavy profile, might benefit from efforts targeting advanced literacy. The regional differences underscore the need for differentiated awareness strategies tailored to local audience maturity.

Table 2.4- Area-wise Awareness on Stocks and Shares

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	34	32	39	21	24	150
Karim Nagar	27	49	31	22	21	150
Khammam	11	14	29	46	50	150
Grand Total	72	95	99	89	95	450

Source: Primary Data

Table 2.4 delineates regional disparities in awareness levels concerning stocks and shares across Warangal, Karim Nagar, and Khammam, based on survey data from 450 respondents. The distribution across five awareness categories reveals pronounced geographical variations, with Warangal exhibiting relatively balanced awareness (predominantly Moderate and Very Aware categories totaling 71 respondents), while Khammam demonstrates substantially lower awareness (75 respondents in the two lowest awareness categories). Notably, Karim Nagar emerges with the strongest representation in the highest awareness tier (Very Aware: 49 respondents), contrasting sharply with Khammam's minimal representation in top awareness categories (Extremely Aware: 11; Very Aware: 14). The aggregated totals indicate that Moderate Awareness constitutes the largest segment (99 respondents, 22.0%), followed closely by Very Aware (95 respondents, 21.1%) and Not at All Aware (95 respondents, 21.1%).

Regional analysis reveals distinctive awareness profiles. Karim Nagar leads in financial literacy with 49 respondents (32.7% of its cohort) reporting "Very Aware" status - the highest absolute count in any single awareness category across regions. Warangal maintains moderate awareness distribution, though with notable proportions in lower awareness tiers (Slightly Aware: 21; Not at All Aware: 24). Khammam presents the most concerning profile, with 50 respondents (33.3% of its sample) reporting complete non-awareness and 46 (30.7%) reporting only slight awareness. This geographical polarization suggests potential correlations between regional economic development, financial education infrastructure, and exposure to equity markets. The

inverse relationship observed between Khammam’s awareness patterns and those of Karim Nagar warrants further investigation into regional determinants of financial knowledge diffusion.

Figure 4: Distribution of awareness levels on stocks and shares across geographical areas

Figure 4 highlights regional variation in the understanding of equity investment instruments. Warangal maintains a relatively even distribution across awareness tiers, with 22.7% ($n = 34$) respondents identified as *Extremely aware* and 26.0% ($n = 39$) as *Moderately aware*, showcasing a mature knowledge curve.

Karim Nagar stands out for having the highest share of *Very aware* individuals—32.7% ($n = 49$)—despite a lower proportion of *Extremely aware* respondents (18.0%, $n = 27$). This indicates a population base that is familiar with but not deeply engaged in stock market mechanisms.

Khammam reveals the most alarming trend. It records the **lowest** in high-tier awareness (just 7.3% *Extremely aware*) while showing very high proportions in *Slightly aware* ($n = 46$, 30.7%) and *Not at all aware* ($n = 50$, 33.3%) categories. This skew toward limited awareness suggests systemic barriers in outreach or access to investment education in this region.

The data reinforces the need for **targeted financial education** efforts in Khammam, with Warangal potentially acting as a model for balanced investment literacy. Meanwhile, Karim Nagar’s audience may benefit from programs that deepen existing awareness into more actionable expertise.

Table 2.5 - Area-wise Awareness on Real Estate

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	68	38	28	10	6	150
Karim Nagar	57	50	18	14	11	150
Khammam	51	29	48	12	10	150
Grand Total	176	117	94	36	27	450

Source: Primary Data

Table 2.5 documents significant geographical variations in awareness of real estate investment opportunities across the Telangana region. Warangal demonstrates the strongest awareness profile, with 68 respondents (45.3% of regional sample) reporting extreme awareness and remarkably low non-awareness (6 respondents, 4%). Karim Nagar presents a distinctive pattern with balanced high awareness (57 extremely aware and 50 very aware), though shows elevated non-awareness (11 respondents). Khammam exhibits a divergent awareness distribution characterized by substantial moderate awareness (48 respondents, 32%) alongside significant extreme awareness (51, 34%), suggesting bifurcated knowledge dissemination in this region. The consistent sample size of 150 respondents per area enables robust regional comparison.

The aggregate data reveals that real estate awareness is predominantly concentrated in higher awareness categories, with extreme and very aware respondents collectively constituting 65.1% (293/450) of the sample. Regional contrasts are particularly evident in awareness distribution: Warangal’s awareness decreases linearly from extreme to non-aware categories, while Karim Nagar

maintains strong high awareness but shows a notable drop in moderate awareness. Khammam’s inverted moderate awareness peak (48 versus Warangal’s 28 and Karim Nagar’s 18) suggests different knowledge acquisition pathways. The overall low non-awareness (27 respondents, 6% of total) indicates real estate’s prominence as an investment vehicle, though regional disparities in awareness depth may reflect variations in real estate market development, property ownership culture, or financial literacy initiatives across districts.

Figure 5: Distribution of awareness levels on real estate across geographical areas

The bar graph in Figure 5 delineates regional variations in awareness levels regarding real estate investment. Warangal leads the awareness spectrum, with 45.3% ($n = 68$) of its respondents falling under the *Extremely aware* category and a further 25.3% ($n = 38$) categorized as *Very aware*, together comprising over 70% of the total sample.

Karim Nagar similarly demonstrates strong awareness, with 38.0% ($n = 57$) *Extremely aware* and 33.3% ($n = 50$) *Very aware*, suggesting high public familiarity with property-related investments. However, it also shows a slightly higher tail in the *Not at all aware* group ($n = 11$) compared to Warangal.

Khammam’s profile is notably distinctive, with a more spread-out distribution. While 34.0% ($n = 51$) are *Extremely aware*, an unusually high 32.0% ($n = 48$) fall under the *Moderately aware* tier. This indicates an informed but not deeply engaged population, with fewer respondents at the lowest awareness tier (only $n = 10$ or 6.7%).

Overall, the data reflects generally strong real estate awareness across all three regions, with Warangal leading in peak awareness and Khammam maintaining a broad base of moderate understanding. Future outreach in Khammam should aim to elevate moderate awareness into deeper expertise, while efforts in Karim Nagar may focus on reducing the remaining low-awareness gap.

Table 2.6 - Area-wise Awareness on Gold

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	33	34	42	22	19	150
Karim Nagar	22	38	46	20	24	150
Khammam	35	36	33	26	20	150
Grand Total	90	108	121	68	63	450

Source: Primary Data

Table 2.6 presents a comparative overview of regional awareness regarding gold investments across Warangal, Karim Nagar, and Khammam, based on responses from 450 individuals. Analysis of the distribution across five awareness categories reveals distinct regional patterns. Warangal exhibits a relatively even spread, with notable concentrations in the mid to high awareness tiers (Extremely Aware: 33; Very Aware: 34; Moderately Aware: 42), reflecting a moderately informed population. Karim Nagar shows strong representation in the upper awareness brackets as well, particularly in the Very Aware (38) and Moderately Aware (46) categories, indicating a well-informed demographic. Khammam, meanwhile, stands out with the highest count in the Extremely Aware category (35), coupled with relatively balanced distribution across other levels. Overall, Moderate Awareness emerges as the largest category (121 respondents, 26.9%), followed closely by Very Aware (108 respondents, 24.0%)

and Extremely Aware (90 respondents, 20.0%).

A closer regional breakdown highlights intriguing nuances. Warangal and Karim Nagar demonstrate similar awareness patterns, though Karim Nagar slightly outpaces Warangal in total upper-tier awareness (Extremely + Very Aware: 60 vs. 67). Khammam, while exhibiting the highest number of respondents in the Extremely Aware category, also maintains substantial figures in lower awareness tiers (Slightly Aware: 26; Not at All Aware: 20), suggesting internal heterogeneity in financial literacy. Notably, all three regions show a relatively low proportion of complete non-awareness, with counts ranging between 19 and 24, indicating a generally positive baseline familiarity with gold as an investment. These findings point toward a broadly distributed awareness landscape, with subtle regional differences likely influenced by cultural preferences, historical trends in gold investment, and localized financial education initiatives.

Figure 6: Distribution of awareness levels on gold across geographical areas

Figure 6 illustrates the distribution of awareness regarding gold investments across Warangal, Karim Nagar, and Khammam. The awareness profile is relatively balanced across districts, with each region showing substantial numbers in both high and moderate awareness categories.

Warangal shows a peak in moderate awareness, with 42 respondents (28.0%) in that category, followed closely by 34 (22.7%) *Very aware* and 33 (22.0%) *Extremely aware*. This suggests a broad base of general awareness, though deep understanding is slightly lower than in other investment types.

Karim Nagar's respondents show the strongest leaning towards moderate knowledge, with 46 respondents (30.7%) *Moderately aware*, and 38 (25.3%) *Very aware*. However, its *Extremely aware* group is the lowest among all three districts (14.7%, $n = 22$), hinting at a knowledge plateau despite general exposure.

Khammam's awareness levels are notably even across categories. It has the highest proportion of *Extremely aware* respondents ($n = 35$, 23.3%) and a consistent presence across all tiers, including the highest count of *Slightly aware* ($n = 26$) and a moderately high count of *Not at all aware* ($n = 20$).

In summary, the data suggests that while all three regions show reasonable gold investment awareness, Warangal and Khammam demonstrate slightly deeper penetration at the top tiers. Karim Nagar, though not lagging in general familiarity, may benefit from targeted educational initiatives to promote deeper financial literacy in gold-related investments.

Table 2.7- Area-wise Awareness on Government Schemes

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	51	32	22	16	29	150
Karim Nagar	50	43	27	22	8	150
Khammam	52	37	32	16	13	150
Grand Total	153	112	81	54	50	450

Source: Primary Data

Table 2.7 outlines the regional distribution of awareness levels pertaining to government schemes across Warangal, Karim Nagar, and Khammam, based on survey data from 450 respondents. The figures reveal distinct regional strengths, particularly in the highest awareness tiers. Khammam leads slightly in the Extremely Aware category (52 respondents), closely followed by Warangal (51) and Karim Nagar (50), suggesting widespread deep familiarity with government schemes across all three regions. Karim Nagar demonstrates a particularly strong showing in the Very Aware segment (43 respondents), while Warangal lags behind slightly in the Moderately Aware and Very Aware tiers (22 and 32 respectively). Aggregated totals show that Extremely Aware is the most populous category (153 respondents, 34.0%), followed by Very Aware (112 respondents, 24.9%) and Moderately Aware (81 respondents, 18.0%).

Regional analysis reveals a generally positive trend in awareness of government schemes. Karim Nagar and Khammam each display high levels of strong awareness, with combined totals in the top two tiers reaching 93 and 89 respondents respectively. Warangal, while also performing well in the top bracket, shows a more polarized distribution, with a substantial 29 respondents reporting complete non-awareness—the highest among the three regions. In contrast, Karim Nagar’s Not at All Aware count is just 8, indicating a strong overall grasp of governmental initiatives. The relatively uniform awareness at the top levels across regions suggests effective dissemination of government information, though Warangal’s elevated low-awareness figures hint at disparities in outreach effectiveness. These patterns merit further study into region-specific communication channels and their effectiveness in delivering public policy information.

Figure 7: Distribution of awareness levels on government schemes across geographical areas

Figure 7 illustrates the regional distribution of financial awareness regarding government-backed schemes across Warangal, Karim Nagar, and Khammam. The overall trend indicates relatively high awareness in all three districts, with more than half the respondents in each region falling within the *Extremely aware* or *Very aware* categories.

Khammam leads slightly in top-tier awareness, with 52 respondents (34.7%) identified as *Extremely aware*, followed closely by Karim Nagar (33.3%, $n = 50$) and Warangal (34.0%, $n = 51$). Karim Nagar stands out in the *Very aware* category, with 43 respondents (28.7%), significantly higher than Warangal (21.3%) and Khammam (24.7%).

Notably, Warangal has the highest proportion of *Not at all aware* respondents (19.3%, $n = 29$), which may indicate localized gaps in outreach or accessibility of government initiatives. In contrast, Karim Nagar shows strong performance on both ends of the spectrum—high levels of awareness with only 5.3% ($n = 8$) lacking any awareness, the lowest among all regions.

These findings underscore the broad reach of government schemes but also highlight region-specific disparities. Warangal’s elevated segment of unaware respondents suggests the need for intensified communication strategies. Meanwhile, the balanced performance of Karim Nagar indicates effective penetration of awareness efforts, serving as a potential model for replication in other districts.

Table 2.8 - Area-wise Awareness on Bonds and Debentures

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	41	42	45	12	10	150
Karim Nagar	23	42	62	12	11	150
Khammam	17	24	55	30	24	150
Grand Total	81	108	162	54	45	450

Source: Primary Data

Table 2.8 captures regional trends in awareness of bonds and debentures across Warangal, Karim Nagar, and Khammam, based on feedback from 450 respondents. The data show clear disparities in financial literacy across regions, especially in the upper awareness tiers. Warangal exhibits a consistently high level of awareness, with strong representation across Extremely Aware (41), Very Aware (42), and Moderately Aware (45) categories, indicating a well-informed demographic. Karim Nagar, while slightly lagging in the highest awareness bracket (Extremely Aware: 23), compensates with the highest number of Moderately Aware respondents (62), suggesting a population with baseline understanding yet room for deeper financial literacy. Khammam presents a more polarized profile, with lower counts in the top tiers (Extremely Aware: 17; Very Aware: 24) and elevated figures in the lower categories (Slightly Aware: 30; Not at All Aware: 24). Overall, Moderately Aware is the dominant awareness level across all regions (162 respondents, 36.0%), followed by Very Aware (108 respondents, 24.0%) and Extremely Aware (81 respondents, 18.0%).

Regional comparison emphasizes Warangal’s balanced and high-performing profile in bond-related awareness, with a combined 128 respondents in the top three tiers. Karim Nagar exhibits a more middle-heavy distribution, with limited representation in the Extremely Aware category but strong footing in Moderate and Very Aware levels. In contrast, Khammam’s low counts in the top tiers and a high concentration in the lowest two categories (Slightly Aware: 30; Not at All Aware: 24) underscore a need for targeted financial education. The overall trend suggests that while awareness of bonds and debentures is gaining traction, regional outreach efforts—particularly in Khammam—must be intensified to bridge knowledge gaps in more complex financial instruments.

Figure 8: Distribution of awareness levels on bonds and debentures across regions

As shown in Figure 8, the awareness of bonds and debentures varies notably across the three studied regions: Warangal, Karim Nagar, and Khammam. Warangal demonstrates the highest awareness levels, with a combined total of 83 respondents falling into the *Extremely aware* and *Very aware* categories. This represents over 60% of the area’s respondents, indicating a strong understanding of debt-based financial instruments.

Karim Nagar’s awareness is dominated by the *Moderately aware* group (62 respondents), suggesting a foundational understanding that could be further improved with targeted financial literacy efforts. Interestingly, this region maintains a lower count in the *Extremely aware* category compared to Warangal, but surpasses it in moderate engagement.

Khammam, in contrast, has a notably lower concentration in the highest awareness categories. While it has a solid 55 respondents in the *Moderately aware* segment, the combined total of those who are *Slightly aware* or *Not at all aware* is 54—making up nearly half of the district’s total responses. This indicates a potential gap in outreach or exposure to bonds and debenture-related knowledge.

Overall, Warangal stands out as a region with a higher financial literacy footprint regarding bonds, while Khammam emerges as a priority region for targeted awareness programs.

Table 2.9 - Area-wise Awareness on Insurance Policies

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	78	32	18	12	10	150
Karim Nagar	52	22	21	28	27	150
Khammam	68	27	19	23	13	150
Grand Total	198	81	58	63	50	450

Source: Primary Data

Table 2.9 presents regional variations in awareness of insurance policies across Warangal, Karim Nagar, and Khammam, derived from a sample of 450 respondents. Warangal demonstrates the strongest awareness profile, with 78 respondents in the Extremely Aware category—the highest single value across all categories and regions—complemented by 32 Very Aware and 18 Moderately Aware respondents. Khammam also shows a high degree of awareness, with 68 Extremely Aware and 27 Very Aware respondents, indicating robust familiarity with insurance instruments. Karim Nagar, however, shows a more dispersed awareness profile, with lower numbers in the top tiers (Extremely Aware: 52; Very Aware: 22) and significantly higher representation in the lower categories (Slightly Aware: 28; Not at All Aware: 27). In aggregate terms, Extremely Aware is the leading category (198 respondents, 44.0%), followed by Very Aware (81 respondents, 18.0%) and Moderately Aware (58 respondents, 12.9%).

Regional breakdowns highlight the dominance of Warangal and Khammam in insurance-related awareness. Warangal’s overall profile suggests concentrated exposure to insurance education or outreach initiatives, with 128 respondents (85.3% of its total) falling within the top three awareness categories. Khammam mirrors this pattern closely with 114 such respondents. Conversely, Karim Nagar’s elevated counts in the lowest awareness levels—55 respondents (36.7%) between Slightly Aware and Not at All Aware—signal a potential gap in access to or engagement with insurance literacy programs. The sharp contrast in awareness distributions suggests region-specific differences in insurance penetration, public communication strategies, or historical reliance on formal risk mitigation mechanisms. These disparities underscore the need for focused awareness drives, particularly in Karim Nagar, to ensure broader and more equitable understanding of insurance policies across the surveyed districts.

Figure 9: Distribution of awareness levels on insurance policies across regions

The graphical representation in Figure 9 illustrates a relatively high level of awareness on insurance policies across all three regions surveyed. Warangal leads with 78 respondents categorizing themselves as *Extremely aware*, demonstrating a strong foothold in insurance literacy. This is closely followed by Khammam with 68 in the same category, indicating a competitive awareness level.

Karim Nagar, while still showcasing a significant level of engagement, lags slightly behind in the top tiers. However, it has a more noticeable presence in the *Slightly aware* and *Not at all aware* categories, accounting for 28 and 27 respondents respectively—suggesting uneven distribution in knowledge.

The consistency across regions in the *Moderately aware* segment further reinforces that insurance as a financial instrument enjoys widespread recognition. Still, there is scope to uplift the bottom tiers through focused education and outreach, particularly in Karim Nagar. Overall, insurance policies appear to be one of the more widely understood financial instruments among the population surveyed.

Table 2.10- Area-wise Awareness on Small Saving Schemes

Area	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Warangal	55	32	21	22	20	150
Karim Nagar	71	40	17	12	10	150
Khammam	63	36	34	9	8	150
Grand Total	189	108	72	43	38	450

Source: Primary Data

Table 2.10 highlights area-wise awareness of small saving schemes among respondents from Warangal, Karim Nagar, and Khammam. Karim Nagar stands out with the highest number of respondents in the Extremely Aware category (71), indicating a strong grasp of small savings instruments such as PPF, NSC, and RD schemes. Khammam follows with 63 respondents in the same category, while Warangal reports 55. Interestingly, Karim Nagar also maintains relatively low figures in the lower awareness levels (Slightly Aware: 12; Not at All Aware: 10), reflecting a well-informed population. Khammam shows a balanced awareness distribution, with strong representation in both Extremely Aware (63) and Moderately Aware (34) categories. Warangal, in contrast, demonstrates a flatter distribution across all tiers, with notable proportions in Slightly Aware (22) and Not at All Aware (20). Overall, the Extremely Aware category dominates with 189 respondents (42.0%), followed by Very Aware (108 respondents, 24.0%) and Moderately Aware (72 respondents, 16.0%).

A regional perspective reveals that Karim Nagar possesses the most favorable awareness profile, combining high counts in the top two tiers (111 respondents, 74.0%) with minimal representation in the lowest ones. Khammam's moderate-to-high awareness levels suggest consistent exposure to savings-related financial information, though the concentration in the Moderately Aware tier signals potential for deepening financial understanding. Warangal's more evenly spread distribution across all categories indicates variability in awareness levels, possibly tied to heterogeneous access to financial services or localized outreach efforts. The data suggest that focused awareness programs in Warangal could elevate its population's understanding of small saving schemes, while sustaining high awareness in Karim Nagar and Khammam through continuous engagement and financial literacy initiatives.

Figure 10: Area-wise awareness distribution on Small Saving Schemes

Figure 10 demonstrates that the awareness of small saving schemes is notably high across all three regions, with Karim Nagar standing out prominently. In Karim Nagar, 71 respondents reported being *Extremely aware*, indicating a widespread penetration of such financial instruments in that locality. Warangal and Khammam also show strong numbers in this top awareness tier, with 55 and 63 respondents respectively.

In the *Very aware* category, all three regions maintain comparable figures, again emphasizing consistent outreach or literacy efforts in this domain. Interestingly, Warangal reports slightly higher values in the lower awareness brackets—*Slightly aware* and *Not at all aware*—suggesting a segment of the population that remains less engaged.

Overall, the trend reflects a robust understanding and recognition of small saving schemes in all surveyed regions. However, targeted awareness campaigns may further reduce the proportion of individuals in the lower-tier categories, especially in Warangal, ensuring financial literacy reaches every stratum of the population.

Awareness of respondents towards savings and investment alternatives based on age

Table 2.11- Age wise Awareness on Bank Deposits

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	12	8	9	8	6	43
25–35	43	12	11	9	8	83
35–45	62	26	16	9	8	121
45–55	52	30	21	21	8	132
Above 55	20	14	15	16	6	71
Grand Total	189	90	72	63	36	450

Source: Primary Data

Table 2.11 presents the distribution of awareness about bank deposit schemes across different age groups. The data highlight that the 35–45 years segment exhibits the highest concentration of highly aware respondents, with 62 individuals classified as Extremely Aware and 26 as Very Aware. The 45–55 years category also shows robust engagement, with 52 and 30 respondents respectively in these top two awareness levels, indicating a strong understanding of bank deposit options among middle-aged participants. Conversely, younger adults (below 25) have relatively lower counts in the highest awareness levels (12 Extremely Aware, 8 Very Aware), suggesting a potential gap in financial literacy at an early life stage.

At the aggregate level, across all ages, the Extremely Aware category dominates (189 respondents), followed by Very Aware (90), and Moderately Aware (72). This trend suggests that a significant portion of the surveyed population has a solid understanding of bank deposit products. Meanwhile, the Slightly Aware and Not at All Aware groups combined comprise roughly a quarter of total respondents, highlighting an area for targeted financial literacy initiatives. The overall distribution emphasizes the role of targeted education and tailored communication strategies to bridge awareness gaps across different age demographics, ensuring more equitable access to and understanding of bank deposit services.

Figure 11: Age-wise Awareness on Bank Deposits

Figure 11 illustrates the distribution of awareness levels across different age groups regarding bank deposit schemes. The trend shows that the 35–45 and 45–55 age groups have the highest concentration of *Extremely Aware* and *Very Aware* respondents, indicating stronger financial literacy within these demographics.

Among younger participants (*Below 25*), awareness tends to be more balanced across categories, with a relatively larger proportion in the *Moderately Aware* and *Slightly Aware* ranges. Meanwhile, in the *Above 55* bracket, despite a notable count of highly aware respondents, there is also a significant portion who remain in the lower awareness tiers, suggesting an area for targeted financial literacy and awareness programs.

Overall, the figure highlights the importance of age-focused strategies for promoting knowledge about bank deposit schemes, reinforcing strong understanding where it already exists, and addressing knowledge gaps where needed.

Table 2.12- Age wise Awareness on Mutual Funds

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	6	8	7	10	12	43
25–35	25	11	20	13	14	83
35–45	36	21	34	6	24	121
45–55	41	28	38	8	29	144
Above 55	18	22	14	8	9	71
Grand Total	126	90	113	45	88	462

Source: Primary Data Table 2.12 presents the distribution of awareness levels regarding mutual funds across different age groups. The 45–55 years age group demonstrates the highest awareness, with 41 respondents identified as Extremely Aware and 28 as Very Aware. Similarly, the 35–45 group also shows notable engagement, recording 36 Extremely Aware and 21 Very Aware individuals. The 25–35 category reveals a moderate awareness profile, with 25 Extremely Aware and 11 Very Aware respondents. Conversely, the Below 25 age group exhibits the lowest awareness levels, with only 6 Extremely Aware and 8 Very Aware individuals, while a significant portion fall into Slightly Aware and Not at All Aware categories. The Above 55 group maintains a fairly even distribution, with a total of 18 Extremely Aware and 22 Very Aware respondents, reflecting a steady but slightly reduced engagement compared to middle-aged participants.

At the overall level, the Extremely Aware category leads with 126 respondents, followed by Very Aware (90) and Moderately Aware (113). However, a combined 133 individuals fall into the Slightly Aware and Not at All Aware categories, suggesting that nearly one-fourth of the total respondents possess limited or no knowledge about mutual funds. This highlights a need for targeted financial education, especially among the younger and least aware demographics, to enhance mutual fund literacy and foster informed investment behavior across age groups.

Table 2.13- Age wise Awareness on Stocks and Shares

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	6	5	6	14	12	43
25–35	22	16	12	15	18	83
35–45	17	24	28	23	29	121
45–55	19	30	38	22	24	133
Above 55	8	20	15	15	12	70
Grand Total	72	95	99	89	95	450

Source: Primary Data

Table 2.13 presents the distribution of awareness levels related to stocks and shares across different age groups. The 45–55 years segment emerges with the highest degree of engagement, registering 19 respondents as Extremely Aware, 30 as Very Aware, and 38 as Moderately Aware. This group demonstrates a strong understanding of equity markets, making it the most informed bracket. The 35–45 years category shows a balanced profile, with notable counts across Very Aware (24) and Moderately Aware (28), although a relatively higher number of respondents (29) remain Not at All Aware, suggesting mixed levels of literacy within this group. Meanwhile, younger adults (below 25) have lower levels of top-tier awareness, with only 6 and 5 respondents in the Extremely Aware and Very Aware categories respectively, and a significant segment (12) being Not at All Aware.

In aggregate terms across all age groups, the Moderately Aware category leads with 93 respondents, followed closely by Very Aware (95) and Extremely Aware (72), indicating that nearly half of the surveyed population has at least a moderate understanding of stock and share markets. Nonetheless, the substantial combined total of 95 respondents falling into the Slightly Aware and Not at All Aware categories highlights an ongoing gap in equity market literacy. This suggests a pressing need for targeted financial education efforts, especially among younger adults and certain middle-aged demographics, to foster a more inclusive and informed approach to investments.

Figure 12: Age-wise Awareness on Stocks and Shares

Figure 12 depicts the awareness levels across different age groups regarding stocks and shares. The trend suggests a higher level of engagement among the 35–45 and 45–55 age brackets, which dominate in the *Very Aware* and *Moderately Aware* categories. Notably, the 45–55 group has the highest counts in both categories, highlighting their deeper understanding and involvement.

In contrast, younger participants (*Below 25*) exhibit a relatively lower level of high awareness and are more clustered within the *Slightly Aware* and *Not at All Aware* segments. Meanwhile, the *Above 55* group displays balanced awareness across levels, suggesting that although some older participants are well-versed, many still remain in lower awareness tiers.

Overall, the figure emphasizes the importance of age-centric financial literacy initiatives, with a particular focus on younger demographics to foster deeper awareness and understanding of stock market investments.

Table 2.14 - Age wise Awareness on Real Estate

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	9	9	10	9	6	43
25–35	26	18	12	14	13	83
35–45	52	42	11	9	7	121
45–55	48	38	33	8	5	132
Above 55	41	10	8	6	6	71
Grand Total	176	117	74	46	37	450

Source: Primary Data

Table 2.14 summarizes the distribution of awareness about real estate across different age groups. The 35–45 years bracket emerges as the most engaged segment, with 52 respondents being *Extremely Aware* and 42 *Very Aware*, making it the leading group in terms of overall awareness. Similarly, the 45–55 years bracket displays a strong understanding, with 48 and 38 respondents falling into the top two awareness tiers respectively. The *Above 55* category also shows a relatively high level of literacy, with 41 *Extremely Aware* and 10 *Very Aware* respondents, although this group has a smaller total compared to younger cohorts. Meanwhile, the *Below 25* and *25–35* brackets have relatively lower counts of *Extremely* and *Very Aware* respondents, suggesting a notable knowledge gap in real estate literacy within these younger demographics.

At the aggregate level, the *Extremely Aware* category dominates across all ages, followed closely by *Very Aware*, indicating that a significant portion of the surveyed population has a strong understanding of real estate. Nonetheless, the presence of *Slightly Aware* and *Not at All Aware* respondents, especially in younger groups, suggests a targeted opportunity for improved financial literacy and outreach. These findings underscore the importance of age-focused education and engagement strategies to cultivate deeper awareness of real estate as an investment option across all demographic segments.

Figure 13: Age-wise Awareness on Real Estate

Figure 13 showcases the awareness levels across different age groups for real estate investments. The trend clearly highlights that the 35–45 and 45–55 age brackets dominate in higher awareness levels (*Extremely Aware* and *Very Aware*), indicating a strong understanding of real estate opportunities within these age groups.

Younger participants (*Below 25*) and those in the 25–35 range tend to have relatively lower numbers in higher awareness tiers, suggesting an area where enhanced financial literacy and targeted campaigns could foster deeper engagement. Meanwhile, those *Above 55* maintain significant levels of *Extremely Aware* respondents, suggesting long-standing experience and knowledge of the real estate market.

In summary, while middle-aged and older participants have a robust awareness of real estate investments, younger demographics present an important opportunity for improved education and outreach.

Table 2.15 - Age wise Awareness on Gold

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	9	10	12	7	5	43
25–35	20	23	18	12	10	83
35–45	32	20	34	16	19	121
45–55	19	42	31	20	20	132
Above 55	10	13	26	13	9	71
Grand Total	90	108	121	68	63	450

Source: Primary Data

Table 2.15 captures the distribution of awareness levels about gold across different age groups. The 45–55 years bracket emerges as the most aware segment, with 19 respondents being *Extremely Aware* and 42 *Very Aware*, making it the leading group in terms of high awareness. The 35–45 years segment also shows a strong understanding, recording 32 *Extremely Aware* and 20 *Very Aware* respondents, alongside the highest count (34) in the *Moderately Aware* category, suggesting a widespread, if varied, familiarity within this group. Meanwhile, younger adults (*Below 25*) have relatively lower counts across the top tiers (9 *Extremely Aware*, 10 *Very Aware*), indicating a potential gap in financial literacy about gold investments.

In aggregate, the *Very Aware* category tops the table across all ages, followed closely by *Moderately Aware* and *Extremely Aware*, highlighting that a significant proportion of the sample has a solid understanding of gold as an investment option. Nonetheless, the notable counts in the *Slightly Aware* and *Not at All Aware* categories, especially within younger and certain middle-aged segments, point to an ongoing need for targeted financial literacy and engagement initiatives. These findings underscore the role that age and experience play in shaping perceptions and knowledge about gold, suggesting a valuable focus area for financial education and awareness campaigns.

Figure 14: Age-wise Awareness on Gold

Figure 14 captures the awareness levels across different age groups with respect to gold investments. The trend clearly highlights that the 25-35, 35-45, and 45-55 brackets dominate in terms of *Extremely Aware*, *Very Aware*, and *Moderately Aware* responses, suggesting strong knowledge and active interest in gold as an investment option within these groups.

The younger segment (*Below 25*) and older segment (*Above 55*) display relatively lower levels of high awareness, implying an area where targeted awareness and literacy efforts could have a significant impact. Notably, the 45-55 age group showcases the highest number of *Very Aware* respondents, underscoring their strong understanding and engagement with gold as an investment option.

In summary, the results emphasize that middle-aged groups (25-55) are more invested and informed about gold, making them a critical demographic for marketing and education efforts related to gold-based financial products.

Table 2.16 - Age wise Awareness on Government Schemes

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	8	12	6	7	10	43
25-35	42	11	10	8	12	83
35-45	52	23	25	12	9	121
45-55	38	44	24	16	20	142
Above 55	13	22	16	11	9	71
Grand Total	153	112	81	54	60	460

Source: Primary Data

Table 2.16 showcases the distribution of awareness levels regarding government schemes across different age groups. The 35-45 years bracket leads in overall engagement, with 52 respondents being *Extremely Aware* and 23 *Very Aware*, making it the segment with the highest concentration of well-informed individuals. The 45-55 years group also shows strong awareness, recording 38 *Extremely Aware* and 44 *Very Aware* respondents, highlighting a deep understanding within this demographic. Meanwhile, the 25-35 years category demonstrates significant awareness as well, with 42 *Extremely Aware* and 11 *Very Aware* participants. In contrast, the younger group (*Below 25*) shows lower engagement across the top tiers, suggesting a potential knowledge gap in this area.

At the aggregate level, the *Extremely Aware* category emerges as the largest segment across all ages, followed closely by the *Very Aware* category, indicating that a significant portion of the surveyed population has a solid understanding of government schemes. Nonetheless, the presence of respondents in the *Slightly Aware* and *Not at All Aware* categories, especially within certain younger and older demographics, highlights the ongoing need for targeted awareness and literacy initiatives. These findings underscore the value of focusing efforts on underrepresented or less engaged groups, ensuring wider access and understanding of government schemes across all age brackets.

Figure 15: Age-wise Awareness on Government Schemes

Figure 15 illustrates the distribution of awareness levels about government schemes across different age groups. The 25–35, 35–45, and 45–55 age brackets show the highest awareness, with significant counts in the *Extremely Aware* and *Very Aware* categories. Notably, the 45–55 group has the highest number of *Very Aware* respondents, suggesting strong engagement and understanding of these programs within this demographic.

The *Below 25* group, while demonstrating some awareness, has a relatively larger proportion in the lower tiers (*Slightly Aware* and *Not at All Aware*), highlighting an area for targeted outreach and literacy campaigns. Meanwhile, the *Above 55* bracket maintains a balanced distribution across awareness levels, suggesting varied exposure and understanding within this segment.

In summary, the results underscore the critical role of focusing financial literacy and awareness efforts towards younger demographics, while reinforcing and leveraging the existing high awareness within the middle-aged groups for broader, community-driven promotion of government schemes.

Table 2.17 - Age wise Awareness on Bonds and Debentures

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	6	8	19	6	4	43
25–35	29	14	9	19	12	83
35–45	28	36	38	13	6	121
45–55	10	39	72	6	5	132
Above 55	8	11	24	10	18	71
Grand Total	81	108	162	54	45	450

Source: Primary Data

Table 2.17 presents the distribution of awareness levels related to bonds and debentures across various age groups. The 45–55 years segment shows the highest overall awareness, with 72 respondents being Moderately Aware and 39 Very Aware, indicating a strong familiarity within this bracket. The 35–45 years group also displays notable awareness, with 38 Moderately Aware and 36 Very Aware respondents, suggesting a balanced understanding across these middle age groups. Meanwhile, younger adults (Below 25) have relatively lower counts of highly aware participants (only 6 Extremely Aware and 8 Very Aware), with a significant portion falling into the Moderately Aware category (19), suggesting a developing understanding.

At the aggregate level, the Moderately Aware category leads across all ages, followed closely by Very Aware and Extremely Aware, indicating that most respondents have at least a basic understanding of bonds and debentures. Nonetheless, the presence of lower awareness levels, especially in the younger (Below 25) and older (Above 55) segments, highlights an ongoing need for tailored financial literacy initiatives. These findings emphasize the role of targeted education and awareness efforts in deepening understanding across all demographics, making fixed-income instruments more accessible and comprehensible to the wider population.

Figure 16: Age-wise Awareness on Bonds and Debentures

Figure 16 shows the distribution of awareness levels about bonds and debentures across different age groups. The 45-55 bracket emerges as the most aware segment, with the highest number of respondents in the *Moderately Aware* and *Very Aware* categories, indicating deep familiarity and interest within this demographic. The 35-45 group also displays significant awareness levels across *Very Aware* and *Moderately Aware* categories, suggesting strong engagement in fixed income instruments.

Meanwhile, younger demographics, especially those *Below 25*, tend to have a higher proportion of *Moderately Aware* and *Slightly Aware* respondents, highlighting an area for targeted education and financial literacy efforts. The *Above 55* segment shows a relatively balanced mix across the awareness levels, with a notable portion still in the *Not at All Aware* category.

In summary, the results emphasize the strong resonance of bonds and debentures within middle-aged groups, suggesting their role as a preferred investment avenue for this demographic, while also pointing to opportunities for expanding awareness and understanding among younger and older generations.

Table 2.18 - Age wise Awareness on Insurance Policies

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	7	8	12	9	7	43
25-35	42	14	11	8	8	83
35-45	62	19	10	14	16	121
45-55	53	27	15	24	13	132
Above 55	34	13	10	8	6	71
Grand Total	198	81	58	63	50	450

Source: Primary Data

Table 2.18 captures the distribution of awareness about insurance policies across different age groups. The 35-45 years bracket emerges as the most engaged segment, with 62 respondents being *Extremely Aware* and 19 *Very Aware*, making it the category with the highest overall levels of understanding. The 45-55 years bracket also shows a strong level of awareness, with 53 *Extremely Aware* and 27 *Very Aware* participants, suggesting a solid knowledge base within this group. Meanwhile, the 25-35 years segment has a notable presence of highly aware respondents (42 *Extremely Aware*), although with relatively lower counts in the *Very Aware* and *Moderately Aware* categories.

At the aggregate level, the *Extremely Aware* category dominates across all ages, followed by the *Very Aware* segment, indicating that a significant portion of the surveyed population possesses a robust understanding of insurance policies. Nonetheless, the presence of *Slightly Aware* and *Not at All Aware* respondents, especially within the younger and older demographics, highlights opportunities for targeted awareness campaigns. These findings underscore the role that focused financial literacy efforts can play in fostering a more inclusive understanding of insurance policies across all age groups.

Figure 17: Age-wise Awareness on Insurance Policies

Figure 17 captures the distribution of awareness levels across different age groups for insurance policies. The data clearly highlights that middle-aged respondents (25–35, 35–45, and 45–55) dominate the *Extremely Aware* and *Very Aware* categories, indicating a strong understanding and focus on insurance as an investment and protection tool within this demographic.

In contrast, younger participants (*Below 25*) and older adults (*Above 55*) show relatively lower levels of high awareness and tend to be more clustered in the *Moderately Aware* and *Slightly Aware* categories. This suggests an area where targeted education and awareness efforts can be applied to expand their understanding and engagement with insurance policies.

Overall, the trend emphasizes that insurance literacy is significantly concentrated in the prime working years, making this segment vital for tailored communication strategies and for driving deeper insurance penetration across all age groups.

Table 2.19 - Age wise Awareness on Small Saving Schemes

Age	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below 25	10	9	7	9	8	43
25–35	32	14	15	14	8	83
35–45	69	29	12	5	6	121
45–55	64	40	19	5	4	132
Above 55	14	16	19	12	10	71
Grand Total	189	108	72	45	36	450

Source: Primary Data

Table 2.19 presents the distribution of awareness about small saving schemes across different age groups. The 35–45 years bracket emerges as the best-informed segment, with 69 respondents being *Extremely Aware* and 29 *Very Aware*, making it the group with the highest levels of awareness. The 45–55 years group also demonstrates strong familiarity, recording 64 *Extremely Aware* and 40 *Very Aware* respondents, indicating a similarly high degree of understanding within this demographic. Meanwhile, younger adults (*Below 25*) have relatively lower counts across the top tiers, suggesting a potential knowledge gap in this area.

At an aggregate level, the *Extremely Aware* category dominates across all ages, followed closely by *Very Aware* respondents, highlighting a generally strong awareness of small saving schemes among the surveyed population. However, the notable presence of *Slightly Aware* and *Not at All Aware* respondents, especially in the younger and oldest demographics, points to the need for targeted financial literacy programs. These findings underscore the role that tailored educational and outreach efforts can play in fostering a more inclusive understanding of small saving options across all age groups.

Figure 18: Age-wise Awareness on Small Saving Schemes

Figure 18 illustrates the distribution of awareness levels for small saving schemes across different age groups. The trend shows that middle-aged groups, especially those in the *35-45* and *45-55* brackets, have a very high level of awareness, with significant counts in the *Extremely Aware* and *Very Aware* categories. This suggests that these demographics recognize the benefits and relevance of small saving schemes as long-term financial planning tools.

Meanwhile, younger respondents (*Below 25* and *25-35*) display lower levels of strong awareness, though a noticeable proportion still falls into the *Moderately Aware* and *Slightly Aware* categories, indicating an area with potential for increased financial literacy efforts. The *Above 55* group maintains relatively balanced awareness across the levels, highlighting a segment that can benefit from targeted engagement and education.

In summary, while middle-aged respondents dominate in understanding small saving schemes, younger and older demographics can benefit from tailored awareness campaigns, making it critical for policymakers and financial institutions to design strategies that foster greater engagement across all age brackets.

Awareness of respondents towards savings and investment alternatives based on Income

Table 2.20 - Income wise Awareness on Bank Deposits

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	6	10	8	7	7	38
Rs.20000-Rs.40000	12	10	8	12	10	52
Rs.40000-Rs.60000	21	14	14	8	7	64
Rs.60000-Rs.80000	28	25	18	11	6	88
Above Rs.80000	122	31	24	25	6	208
Grand Total	189	90	72	63	36	450

Source: Primary Data

Table 2.20 presents the distribution of awareness levels related to bank deposits across different income groups. The highest income bracket (Above Rs.80,000) emerges as the most informed segment, with 122 respondents classified as Extremely Aware, 31 as Very Aware, and 24 as Moderately Aware, indicating strong familiarity with bank deposit options. The Rs.60,000–Rs.80,000 range also shows substantial awareness, with 28 Extremely Aware and 25 Very Aware respondents, suggesting an overall robust understanding within this category. Meanwhile, the lower income groups (Below Rs.20,000 and Rs.20,000–Rs.40,000) have relatively modest levels of awareness across the top tiers, highlighting a potential knowledge gap.

At an aggregate level, the Extremely Aware category dominates across income levels, followed by Very Aware and Moderately Aware, implying that awareness of bank deposit products improves with income. Nonetheless, the presence of Slightly Aware and Not at All Aware respondents across all income groups suggests the continued need for tailored financial literacy efforts. These findings underscore the role of income in shaping awareness patterns, highlighting opportunities for targeted interventions to foster greater financial inclusion and understanding across all income brackets.

Figure 19: Income-wise Awareness on Bank Deposits

Figure 19 illustrates the distribution of awareness about bank deposit products across different income levels. The trend clearly shows that the *Above Rs.80000* income bracket dominates in the *Extremely Aware* category, with a significant count of 122 respondents, underscoring the strong financial literacy and access to banking services within this group.

Middle income brackets (*Rs.40000–Rs.60000* and *Rs.60000–Rs.80000*) also display notable awareness across the *Very Aware* and *Moderately Aware* categories, indicating an active interest and understanding of banking products within this segment. Conversely, lower income groups (*Below Rs.20000* and *Rs.20000–Rs.40000*) have relatively higher counts in the *Slightly Aware* and *Not at All Aware* columns, highlighting a gap in financial literacy and access.

Overall, the data suggests a direct relationship between income levels and awareness about bank deposit products, emphasizing the need for tailored financial literacy programs targeted at lower income groups to foster more inclusive participation in formal

banking services.

Table 2.21 - Income wise Awareness on Mutual Funds

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	3	4	12	8	11	38
Rs.20000-Rs.40000	9	12	10	7	14	52
Rs.40000-Rs.60000	18	16	15	6	9	64
Rs.60000-Rs.80000	28	18	24	8	10	88
Above Rs.80000	68	40	52	16	32	208
Grand Total	126	90	113	45	76	450

Source: Primary Data

Table 2.21 provides a comprehensive view of awareness levels related to mutual fund investments across different income brackets. The highest income group (Above Rs.80,000) emerges as the best informed segment, with 68 respondents being Extremely Aware, 40 Very Aware, and 52 Moderately Aware, indicating strong familiarity and engagement with mutual fund products. The Rs.60,000–Rs.80,000 bracket also displays notable awareness, recording 28 Extremely Aware and 18 Very Aware respondents, suggesting growing financial literacy within this range. Meanwhile, lower income groups, such as those earning Below Rs.20,000, have relatively low counts across the top tiers and a higher proportion falling into the Moderately Aware, Slightly Aware, and Not at All Aware categories.

At an aggregate level, the data reveal a clear trend: as income increases, so too does the depth of awareness about mutual funds. The total number of Extremely Aware and Very Aware respondents is concentrated in the higher income groups, highlighting a significant disparity when compared to lower income brackets. This underscores the potential for targeted financial literacy and investment awareness campaigns, especially within low and middle income groups, to foster a more inclusive understanding and participation in mutual fund investments across the socioeconomic spectrum.

Figure 20: Income-wise Awareness on Mutual Funds

Figure 20 illustrates the distribution of awareness about mutual funds across different income levels. The trend clearly highlights that the *Above Rs.80000* income bracket leads across most awareness categories, with the highest counts in the *Extremely Aware* (68 respondents), *Very Aware* (40), and *Moderately Aware* (52) groups, indicating a strong understanding and engagement with mutual fund investment options within this segment.

Middle income groups (*Rs.60000–Rs.80000* and *Rs.40000–Rs.60000*) also show substantial awareness, with notable counts in the *Very Aware* and *Moderately Aware* columns, suggesting an active interest and access to mutual fund products. Conversely, lower income groups (*Below Rs.20000* and *Rs.20000–Rs.40000*) have relatively higher counts in the *Slightly Aware* and *Not at All Aware* categories, highlighting a significant gap in financial literacy and investment accessibility.

Overall, the data underscores the direct relationship between income levels and awareness about mutual fund products. Tailored financial literacy programs, especially aimed at lower income groups, can help bridge this gap and foster more inclusive participation in the mutual fund market.

Table 2.22 - Income wise Awareness on Stocks and Shares

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	2	3	8	7	18	38
Rs.20000-Rs.40000	6	8	9	9	20	52
Rs.40000-Rs.60000	8	10	14	14	18	64
Rs.60000-Rs.80000	22	13	19	18	16	88
Above Rs.80000	34	61	48	42	23	208
Grand Total	72	95	98	90	95	450

Source: Primary Data

Table 2.22 summarizes the awareness levels related to stocks and shares across different income brackets. The highest income group (Above Rs.80,000) demonstrates the strongest understanding of this investment avenue, with 34 respondents being Extremely Aware, 61 Very Aware, and 48 Moderately Aware — making it the segment with the highest concentration of informed participants. The Rs.60,000–Rs.80,000 bracket also reflects significant awareness, recording 22 Extremely Aware and 13 Very Aware respondents, suggesting that familiarity with equity investment grows notably with income.

Meanwhile, lower income groups (Below Rs.20,000 and Rs.20,000–Rs.40,000) present relatively modest awareness levels across the top tiers and higher counts in the Not at All Aware category, highlighting a clear gap in financial literacy related to stocks and shares. At an aggregate level, the data point to a strong trend wherein awareness improves alongside rising income, with higher income brackets dominating the Extremely Aware and Very Aware categories. These findings underscore the need for targeted financial education and awareness campaigns within lower income groups to foster more inclusive participation in the equity markets.

Figure 21: Income-wise Awareness on Stocks and Shares

Figure 21 provides a clear depiction of the awareness of Stocks and Shares across various income groups. The trend showcases a strong correlation between income and awareness levels. In the highest income bracket (*Above Rs.80000*), a significant number of respondents (34 *Extremely Aware* and 61 *Very Aware*) demonstrate strong understanding and participation in stock and share investments.

Middle income brackets (particularly Rs.60000–Rs.80000) also display notable awareness levels, with balanced counts across *Extremely Aware*, *Very Aware*, and *Moderately Aware* categories, suggesting active interest and exposure to the stock market. Meanwhile, the lower income brackets (such as *Below Rs.20000* and *Rs.20000–Rs.40000*) have higher counts in the *Slightly Aware*

and *Not at All Aware* columns, pointing towards a knowledge gap that could benefit from targeted literacy and accessibility programs.

Overall, the trend confirms a strong link between income and awareness of stock and share investments, highlighting the need for tailored financial literacy interventions aimed at lower income groups to foster wider participation in capital markets.

Table 2.23 - Income wise Awareness on Real Estate

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	6	8	10	8	6	38
Rs.20000-Rs.40000	14	17	12	5	4	52
Rs.40000-Rs.60000	22	17	14	6	5	64
Rs.60000-Rs.80000	32	23	22	6	5	88
Above Rs.80000	102	52	36	11	7	208
Grand Total	176	117	94	36	27	450

Source: Primary Data

Table 2.23 summarizes the awareness levels related to stocks and shares across different income brackets. The highest income group (Above Rs.80,000) demonstrates the strongest understanding of this investment avenue, with 34 respondents being Extremely Aware, 48 Moderately Aware — making it the segment with the highest concentration of informed participants. The Rs.60,000–Rs.80,000 bracket also reflects significant awareness, recording 22 Extremely Aware and 13 Very Aware respondents, suggesting that familiarity with equity investment grows notably with income.

Meanwhile, lower income groups (Below Rs.20,000 and Rs.20,000–Rs.40,000) present relatively modest awareness levels across the top tiers and higher counts in the Not at All Aware category, highlighting a clear gap in financial literacy related to stocks and shares. At an aggregate level, the data point to a strong trend wherein awareness improves alongside rising income, with higher income brackets dominating the Extremely Aware and Very Aware categories. These findings underscore the need for targeted financial education and awareness campaigns within lower income groups to foster more inclusive participation in the equity markets.

Figure 22: Income-wise Awareness on Real Estate

Figure 22 captures the distribution of awareness levels for Real Estate across varying income brackets. The trend highlights a sharp rise in the proportion of *Extremely Aware* respondents in the highest income group (*Above Rs.80000*), with 102 respondents falling in this category, indicating a strong link between higher income and awareness of real estate investment opportunities.

Middle income groups (such as *Rs.60000–Rs.80000* and *Rs.40000–Rs.60000*) also show considerable awareness across the *Extremely Aware*, *Very Aware*, and *Moderately Aware* levels. Conversely, lower income groups (*Below Rs.20000* and *Rs.20000–Rs.40000*) have relatively higher counts in the *Slightly Aware* and *Not at All Aware* categories, suggesting a potential knowledge or acces-

sibility gap.

Overall, the data emphasizes the significant role income plays in shaping awareness about real estate, highlighting the need for targeted literacy programs and financial planning support for lower income groups to foster more inclusive access to real estate investments.

Table 2.24 - Income wise Awareness on Gold

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	7	8	9	9	5	38
Rs.20000-Rs.40000	14	12	10	10	6	52
Rs.40000-Rs.60000	16	10	19	11	8	64
Rs.60000-Rs.80000	14	19	19	18	18	88
Above Rs.80000	39	59	64	20	26	208
Grand Total	90	108	121	68	63	450

Source: Primary Data

Table 2.24 captures the awareness levels of gold as an investment option across different income brackets. The highest income group (Above Rs.80,000) shows the greatest degree of awareness, with 39 respondents being Extremely Aware, 59 Very Aware, and 64 Moderately Aware — making this segment the best informed about gold. The Rs.60,000–Rs.80,000 bracket also shows significant awareness levels, recording 14 Extremely Aware, 19 Very Aware, and 19 Moderately Aware respondents, indicating strong familiarity within the upper-middle income segment as well.

Meanwhile, the lower income groups (Below Rs.20,000 and Rs.20,000–Rs.40,000) register relatively modest numbers across the higher awareness tiers and a higher proportion of respondents in the Slightly Aware and Not at All Aware categories. At an aggregate level, the results clearly depict a trend wherein increasing income is associated with greater awareness of gold as an investment avenue. This highlights the role of income in shaping access to information and comfort with traditional investment options like gold, suggesting an ongoing need for targeted financial literacy efforts for lower income groups to foster more equitable awareness across income levels.

Figure 23: Income-wise Awareness on Gold

Figure 23 illustrates the awareness about Gold across different income brackets. The trend clearly shows that higher income groups, especially those earning Above Rs.80,000, dominate in terms of awareness across the *Extremely Aware*, *Very Aware*, and *Moderately Aware* categories. This suggests a stronger engagement and interest in gold as an investment option among higher income individuals.

Middle income groups (*Rs.60000–Rs.80000* and *Rs.40000–Rs.60000*) also display significant awareness levels across the top three categories, highlighting a growing trend of consideration of gold as a viable investment. Meanwhile, the lower income

bracket (*Below Rs.20000*) has relatively higher proportions in the *Slightly Aware* and *Not at All Aware* columns, indicating a potential area for targeted awareness campaigns.

Overall, the chart and data reveal a direct relationship between income and awareness of gold as an investment, suggesting that as income increases, awareness and active consideration of gold investment options also rise significantly.

Table 2.25 - Income wise Awareness on Government Schemes

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	8	6	12	4	8	38
Rs.20000-Rs.40000	16	9	10	8	9	52
Rs.40000-Rs.60000	18	11	14	9	12	64
Rs.60000-Rs.80000	34	18	15	13	8	88
Above Rs.80000	77	68	30	20	13	208
Grand Total	153	112	81	54	50	450

Source: Primary Data

Table 2.25 illustrates how awareness of Government Schemes varies across different income groups. The highest income bracket (Above Rs.80,000) shows the strongest awareness, with 77 respondents identifying as Extremely Aware and 68 as Very Aware — making this segment the best informed across all awareness levels. The Rs.60,000–Rs.80,000 bracket also demonstrates relatively strong awareness, with 34 Extremely Aware and 18 Very Aware respondents, suggesting a significant level of engagement and understanding within this group.

In contrast, the lower income groups (Below Rs.20,000 and Rs.20,000–Rs.40,000) register comparatively weaker awareness levels. Notably, the “Not at All Aware” category comprises 8 and 9 respondents, respectively, indicating that a notable portion of these income brackets lacks exposure to or understanding of available Government Schemes. The Rs.40,000–Rs.60,000 bracket shows a balanced trend across the various awareness levels, suggesting a gradual shift towards higher awareness with increasing income.

In summary, higher income levels correlate with stronger awareness and knowledge of Government Schemes, highlighting the role income plays in access to information and uptake of these benefits. The findings underscore the need for targeted efforts to educate lower income groups and ensure equitable participation in Government Schemes across all economic segments.

Figure 24: Income-wise Awareness on Government Schemes

Figure 24 highlights the awareness levels about Government Schemes across different income groups. The data clearly demonstrates that the Above Rs.80000 group has the highest level of awareness, with a significant proportion marked as *Extremely Aware* (77) and *Very Aware* (68), suggesting strong engagement with or access to information about these schemes.

Middle income groups (*Rs.60000–Rs.80000* and *Rs.40000–Rs.60000*) also display noticeable awareness, with an appreciable number of respondents falling into the top three categories. Meanwhile, the lower income brackets (*Below Rs.20000* and *Rs.20000–Rs.40000*) have relatively higher counts in the *Not at All Aware* and *Slightly Aware* columns, indicating a significant gap in access or exposure.

The chart and statistics underscore the direct link between income and awareness, implying the necessity for targeted efforts and improved dissemination of information about government schemes among lower income groups.

Table 2.26 - Income wise Awareness on Bonds and Debentures

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	3	6	10	11	8	38
Rs.20000-Rs.40000	10	11	8	14	9	52
Rs.40000-Rs.60000	14	16	16	10	8	64
Rs.60000-Rs.80000	16	26	30	8	8	88
Above Rs.80000	38	49	98	11	12	208
Grand Total	81	108	162	54	45	450

Source: Primary Data

Table 2.26 highlights the level of awareness about Bonds and Debentures across different income groups. Awareness is highest in the top income bracket (Above Rs.80,000), with 38 respondents being Extremely Aware, 49 Very Aware, and a remarkable 98 Moderately Aware, indicating that higher income is closely associated with better understanding of this investment avenue.

In contrast, lower income groups, especially those earning Below Rs.20,000 and Rs.20,000–Rs.40,000, exhibit relatively low levels of awareness. These groups have the highest counts in the “Slightly Aware” and “Not at All Aware” categories, suggesting a limited understanding or exposure to Bonds and Debentures. Meanwhile, middle income brackets such as Rs.40,000–Rs.60,000 and Rs.60,000–Rs.80,000 show a balanced trend, with a noticeable shift towards Moderate and Very Aware levels.

In summary, this data clearly suggests that higher income levels have a strong correlation with greater awareness and knowledge about Bonds and Debentures. This emphasizes the need for targeted financial literacy efforts in lower income groups to ensure more inclusive access to long-term investment opportunities.

Figure 25: Income-wise Awareness on Bonds and Debentures

Figure 25 illustrates the distribution of awareness levels about Bonds and Debentures across various income groups. The trend highlights that the Above Rs.80000 category has the highest awareness, with a significant number of respondents in the *Moderately Aware* (98), *Very Aware* (49), and *Extremely Aware* (38) groups, demonstrating an in-depth understanding and interest in these investment avenues.

Middle income brackets, especially the *Rs.60000–Rs.80000* category, also show considerable engagement, with notable counts in the *Moderately Aware* and *Very Aware* columns. Conversely, lower income groups (*Below Rs.20000* and *Rs.20000–Rs.40000*) have relatively higher counts in the *Slightly Aware* and *Not at All Aware* columns, highlighting a gap in awareness and access.

The data clearly suggests that as income increases, so too does the level of awareness about bonds and debentures, reinforcing the necessity for targeted financial literacy and investment outreach within lower income groups to foster wider participation and understanding.

Table 2.27- Income wise Awareness on Insurance Policies

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	8	6	12	8	4	38
Rs.20000-Rs.40000	22	8	8	6	8	52
Rs.40000-Rs.60000	20	12	11	12	9	64
Rs.60000-Rs.80000	31	18	12	16	11	88
Above Rs.80000	117	37	15	21	18	208
Grand Total	198	81	58	63	50	450

Source: Primary Data

Table 2.27 analyzes awareness of Insurance Policies across different income brackets. The trend clearly highlights that awareness levels rise sharply with income. The highest income group (Above Rs.80,000) shows the strongest awareness, with 117 respondents being Extremely Aware, 37 Very Aware, and 15 Moderately Aware, making up a significant portion of the total.

In contrast, lower income groups, especially those earning Below Rs.20,000, have relatively low awareness, with only 8 respondents being Extremely Aware and the majority concentrated in the Moderately Aware and Not at All Aware categories. Similar patterns are observed in the Rs.20,000–Rs.40,000 bracket, where a combined total of only 22 respondents fall into the highest awareness levels.

As income increases, awareness improves significantly. The Rs.60,000–Rs.80,000 bracket, for example, shows a more balanced distribution across all awareness levels. This suggests a strong correlation between higher income and increased knowledge about insurance policies, highlighting the importance of targeted financial literacy and awareness programs for lower income groups.

Figure 26: Income-wise Awareness on Insurance Policies

Figure 26 illustrates the distribution of awareness about insurance policies across different income groups. The trend clearly shows that the highest income bracket (*Above Rs.80000*) has the largest proportion of *Extremely Aware* respondents, with 117 indicating a strong understanding and access to insurance products.

Middle income groups (such as *Rs.60000–Rs.80000*) also show notable levels of awareness across the *Extremely Aware* and *Very Aware* categories, suggesting a growing interest and engagement in insurance policies within this segment. In contrast, lower income groups (such as *Below Rs.20000* and *Rs.20000–Rs.40000*) have relatively higher counts in the *Slightly Aware* and *Not at All Aware* categories, indicating a significant knowledge gap.

The data suggests a direct link between income and insurance literacy, highlighting the need for targeted awareness and education campaigns for lower income groups. By addressing this gap, more inclusive access to insurance policies can be facilitated, strengthening the overall financial resilience of society.

Table 2.28 - Income wise Awareness on Small Savings Scheme

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Below Rs.20000	6	6	8	10	8	38
Rs.20000-Rs.40000	18	11	9	8	6	52
Rs.40000-Rs.60000	26	17	10	7	4	64
Rs.60000-Rs.80000	32	26	16	8	6	88
Above Rs.80000	107	48	29	12	12	208
Grand Total	189	108	72	45	36	450

Source: Primary Data

Table 2.28 shows that awareness of Small Savings Schemes increases sharply with income. In the highest bracket (Above Rs.80,000), 107 respondents reported being Extremely Aware, with an additional 48 being Very Aware, making this group the most informed overall. The Rs.60,000–Rs.80,000 bracket also reflects strong awareness, with 32 Extremely Aware and 26 Very Aware respondents.

Conversely, lower income groups, especially those earning Below Rs.20,000, show relatively low levels of awareness. Only 6 respondents identified as Extremely Aware, while 10 respondents fell into the Slightly Aware category, indicating a gap in understanding. Similar trends are observed in the Rs.20,000–Rs.40,000 range, where awareness remains concentrated in the Moderate and Slightly Aware levels.

In summary, the data suggests a strong link between income level and awareness of Small Savings Schemes. Higher income groups tend to have a more robust understanding, highlighting the need for targeted financial literacy efforts to raise awareness among lower income segments.

Figure 27: Income-wise Awareness on Small Savings Schemes

Figure 27 displays the distribution of awareness about small savings schemes across different income levels. The trend highlights

that higher income groups, especially those in the *Above Rs.80000* category, have the highest number of respondents (*107*) identifying as *Extremely Aware*, indicating a strong understanding and active interest in small savings instruments.

Middle income brackets (*Rs.40000–Rs.60000* and *Rs.60000–Rs.80000*) also register significant awareness, suggesting a growing tendency towards investment and financial planning within these segments. Conversely, lower income brackets, such as *Below Rs.20000* and *Rs.20000–Rs.40000*, show relatively higher counts in the *Slightly Aware* and *Not at All Aware* categories, pointing towards a knowledge gap and limited access to small savings schemes.

Overall, the data suggests a direct link between income levels and awareness of small savings options. Targeted efforts to educate and expand access for lower income groups can bridge this gap, promoting inclusive financial literacy and participation in long-term savings instruments.

Awareness of respondents towards savings and investment alternatives based on Education

Table 2.30 - Education wise Awareness on Bank Deposits

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	43	35	25	24	18	145
Post Graduation	137	49	39	35	15	275
Other	9	6	8	4	3	30
Grand Total	189	90	72	63	36	450

Source: Primary Data

Table 2.30 presents the awareness levels on bank deposit schemes across different education groups. Respondents with post-graduation qualifications clearly lead in awareness, with 137 reporting that they are Extremely Aware and 49 stating they are Very Aware. The trend is similarly strong among graduates, where 43 identified as Extremely Aware and 35 as Very Aware.

In contrast, those in the 'Other' education category show lower overall awareness, with only 9 indicating that they are Extremely Aware and 6 as Very Aware. Moderate and slight awareness levels are more balanced across the groups, suggesting a general understanding of bank deposit schemes, but highlighting a significant disparity between higher and lower educational qualifications.

In summary, education appears to be an important determinant of financial awareness when it comes to bank deposit schemes, suggesting the need for tailored awareness and literacy efforts for those with lower formal education levels.

Figure 28: Education-wise Awareness on Bank Deposits

Figure 28 illustrates the distribution of awareness about bank deposit products across different education levels. The trend clearly shows that the *Post Graduation* category has the highest number of *Extremely Aware* respondents (137), highlighting that higher education is closely associated with increased financial literacy and banking awareness.

The *Graduation* category also shows a strong understanding, with a significant portion being *Extremely Aware* (43) or *Very Aware* (35), suggesting a moderately well-informed group. Meanwhile, those in the *Other* category have relatively low awareness across all levels, indicating a potential area for targeted financial literacy interventions.

Overall, the data confirms the direct link between higher educational attainment and heightened awareness of bank deposit products, making a case for expanding financial literacy efforts within lower education groups to foster a more inclusive banking environment.

Table 2.31 - Education wise Awareness on Mutual Funds

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	32	32	36	18	27	145
Post Graduation	91	53	70	20	41	275
Other	3	5	7	7	8	30
Grand Total	126	90	113	45	76	450

Source: Primary Data

Table 2.31 shows the level of awareness about Mutual Fund investments across different education levels. The results clearly highlight that respondents with higher education have a much stronger awareness of Mutual Fund products. In the post-graduation category, 91 respondents stated that they were *Extremely Aware*, and 53 indicated that they were *Very Aware*. In contrast, the graduates group had relatively lower levels of high awareness, with 32 being *Extremely Aware* and an equal number being *Very Aware*.

Meanwhile, respondents with an "Other" education background reflected a significantly lower level of awareness overall, with only 3 expressing that they were *Extremely Aware*, and the majority indicating moderate, slight, or no awareness.

These findings imply a strong link between the level of formal education and awareness about Mutual Fund investments, suggesting a need for targeted financial literacy efforts aimed at those with lower education levels.

Figure 29: Education-wise Awareness on Mutual Funds

Figure 29 presents the distribution of awareness about mutual funds across different education levels. The trend highlights that the *Post Graduation* category exhibits the highest awareness, with significant counts in the *Extremely Aware* (91), *Very Aware* (53), and *Moderately Aware* (70) columns. This emphasizes the stronger financial literacy and interest in mutual fund

investments within this group.

The *Graduation* group also shows a balanced spread across all awareness levels, indicating a moderate understanding of mutual fund products. Meanwhile, the *Other* category reflects relatively lower awareness across the board, suggesting a potential area for targeted financial literacy and investment awareness campaigns.

Overall, the data suggests a clear link between higher education levels and greater awareness of mutual fund products. Expanding financial literacy efforts to less educated demographics can help bridge this gap and foster more inclusive participation in mutual fund investments.

Table 2.32 - Education wise Awareness on Stocks and Shares

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	18	18	42	32	35	145
Post Graduation	52	74	51	49	50	276
Other	2	3	6	8	10	29
Grand Total	72	95	99	89	95	450

Source: Primary Data

Table 2.32 presents the level of awareness about Stocks and Shares across different educational qualifications. The data clearly shows that higher education is associated with increased awareness and understanding of this investment option. Among Post Graduates, 52 respondents stated that they were *Extremely Aware*, and 74 were *Very Aware*, making this group the most knowledgeable about the subject.

In contrast, among those with only a Graduation qualification, 18 respondents expressed being *Extremely Aware*, while another 18 indicated being *Very Aware*. Meanwhile, participants in the Other category demonstrated the lowest levels of awareness, with only 2 stating they were *Extremely Aware* and 3 stating they were *Very Aware*.

These results highlight a strong link between higher education and financial literacy related to Stocks and Shares, underscoring the need for targeted financial education efforts, especially for those with lower or alternative educational qualifications.

Figure 30: Education-wise Awareness on Stocks and Shares

Figure 30 illustrates the awareness about stocks and shares across different education levels. The *Post Graduation* group clearly dominates, especially in the *Very Aware* category (74), followed by significant numbers in the *Moderately Aware* (51) and *Not at All Aware* (50) segments. This trend highlights that higher educational qualifications are associated with a deeper understanding of stock and share investments.

In contrast, the *Graduation* group shows a more balanced distribution across the awareness levels, indicating moderate exposure, while the *Other* category reflects relatively low awareness across all levels.

Overall, the data suggests a strong correlation between educational attainment and awareness of financial instruments like stocks and shares. To broaden participation, targeted financial literacy and investment programs should focus more on lower-educated groups.

Table 2.33 - Education wise Awareness on Real Estate

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	58	30	36	12	9	145
Post Graduation	112	82	51	16	14	275
Other	6	5	7	8	4	30
Grand Total	176	117	94	36	27	450

Source: Primary Data

Table 2.33 shows the distribution of awareness levels about Real Estate across different educational qualifications. The data clearly reflects that higher education correlates with greater awareness about this investment avenue.

Among Post Graduates, 112 respondents identified as *Extremely Aware* of real estate investments, followed by 82 being *Very Aware*. This group exhibited the highest overall awareness. Meanwhile, the Graduation group had 58 respondents in the *Extremely Aware* category and 30 as *Very Aware*.

In contrast, those in the Other education category demonstrated relatively lower levels of awareness, with only 6 being *Extremely Aware*, 5 *Very Aware*, and 7 *Moderately Aware*.

This trend suggests that formal higher education may play an important role in spreading knowledge about real estate as an investment option. It also highlights an area of focus for awareness and financial literacy initiatives for those with lesser formal education.

Figure 31: Education-wise Awareness on Real Estate

Figure 31 showcases the awareness of real estate across different education levels. The *Post Graduation* group emerges as the most informed, with 112 respondents being *Extremely Aware* and 82 being *Very Aware*. Meanwhile, the *Graduation* category reflects relatively strong awareness, with significant counts across *Extremely Aware* and *Very Aware*. The *Other* category, however, shows lower overall engagement, with smaller counts across all awareness levels.

These results clearly indicate a strong correlation between higher education and higher levels of awareness about real estate as an investment option. The data suggests an opportunity for targeted financial literacy and awareness programs aimed at lower education levels, which could foster broader participation and understanding of this crucial investment avenue.

Table 2.34- Education wise Awareness on Gold

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	29	29	42	26	19	145
Post Graduation	55	74	71	36	39	275
Other	6	5	8	6	5	30
Grand Total	90	108	121	68	63	450

Source: Primary Data

Table 2.34 presents the awareness levels of people regarding Gold as an investment option across different education levels. The results highlight a trend where higher education is generally associated with higher awareness levels.

The Post Graduation category shows the highest number of respondents across almost all awareness levels, with 55 being *Extremely Aware*, 74 *Very Aware*, and 71 *Moderately Aware*. This trend suggests that individuals with advanced education tend to be more informed about gold as an investment.

The Graduation category also shows a considerable number of highly aware respondents (29 *Extremely Aware* and 29 *Very Aware*), indicating a generally strong understanding of gold as an investment option.

In contrast, those in the Other category have lower awareness levels across the board, with only 6 being *Extremely Aware* and 5 *Very Aware*.

These findings emphasize the role that education plays in spreading financial literacy, especially for traditional and well-established investment options like gold.

Figure 32: Education-wise Awareness on Gold

Figure 32 illustrates the awareness levels for gold as an investment across various education groups. The *Post Graduation* segment clearly leads across almost all awareness levels, with a significant concentration in the *Very Aware* (74) and *Moderately Aware* (71) categories.

Graduation-level respondents also demonstrate strong knowledge, especially in the *Extremely Aware* (29) and *Very Aware* (29)

categories, indicating a relatively high comfort level with gold investments. Meanwhile, the *Other* category, though smaller, shows balanced awareness across the levels.

This trend highlights the correlation between higher educational attainment and higher levels of awareness and understanding of gold as an investment option. It suggests that targeted financial literacy efforts aimed at those with lower or alternative education levels could further broaden the appeal and understanding of gold investments.

Table 2.35 - Education wise Awareness on Government Schemes

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	53	29	29	16	18	145
Post Graduation	98	79	45	30	23	275
Other	2	4	7	8	9	30
Grand Total	153	112	81	54	50	450

Source: Primary Data

Table 2.35 summarizes the levels of awareness about Government Schemes across various education groups.

The data clearly shows that Post Graduates have the highest awareness across all levels, with 98 respondents being *Extremely Aware* and 79 being *Very Aware*. This suggests that higher education levels are closely associated with better knowledge and understanding of available government schemes.

In comparison, those with a Graduation degree also show significant awareness (53 *Extremely Aware*, 29 *Very Aware*), although at slightly lower levels than postgraduates.

Meanwhile, the Other category (representing lower or different education levels) has the least awareness, with only 2 *Extremely Aware* and 4 *Very Aware* respondents.

These results highlight the strong link between education and financial literacy, especially in terms of understanding and utilizing government-backed saving and investment schemes.

Figure 33: Education-wise Awareness on Government Schemes

Figure 33 shows the distribution of awareness levels for Government Schemes across different education levels. The Post Graduates dominate in overall awareness, with high counts in the *Extremely Aware* (98) and *Very Aware* (79) categories, indicating greater exposure and understanding of such schemes. The Graduation category also shows a balanced spread, with

significant numbers across all levels of awareness. Meanwhile, the Other category demonstrates relatively low levels of awareness across the spectrum, suggesting an area where targeted educational or outreach efforts could be impactful.

Table 2.36 - Education wise Awareness on Bonds and Debentures

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	17	31	62	17	18	145
Post Graduation	61	72	94	29	19	275
Other	3	5	6	8	8	30
Grand Total	81	108	162	54	45	450

Source: Primary Data

Table 2.36 illustrates the level of awareness about Bonds and Debentures across different education levels.

The data clearly shows that Post Graduates have the highest overall awareness, with 61 respondents being *Extremely Aware*, 72 being *Very Aware*, and 94 being *Moderately Aware*. This trend highlights the strong role of higher education in understanding and evaluating fixed income investments like bonds and debentures.

Graduation level respondents also demonstrate significant awareness, especially in the *Very Aware* (31) and *Moderately Aware* (62) categories, although their numbers remain lower compared to the post-graduation group.

Meanwhile, the Other category shows relatively low awareness across all levels, indicating a potential gap in financial literacy for this group.

In conclusion, higher educational attainment appears to be positively associated with increased awareness of bonds and debentures, suggesting an important link between formal education and financial literacy.

Figure 34: Education-wise Awareness on Bonds and Debentures

Figure 34 illustrates the levels of awareness about Bonds and Debentures across different education levels. The majority of Post Graduates have higher awareness levels, with significant counts in the *Very Aware* (72) and *Moderately Aware* (94) categories, suggesting a better understanding of these investment instruments. Graduation holders also have relatively balanced awareness across levels, whereas the Other category shows low engagement across awareness levels, highlighting the role of education in fostering awareness about Bonds and Debentures.

Table 2.37 - Education wise Awareness on Insurance Policies

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	53	36	19	19	18	145
Post Graduation	141	40	31	37	26	275
Other	4	5	8	7	6	30
Grand Total	198	81	58	63	50	450

Source: Primary Data

Table 2.37 provides an overview of how awareness about Insurance Policies varies across different educational levels.

The data clearly shows that Post Graduates have the highest level of awareness, with 141 respondents being *Extremely Aware*, followed by significant counts for those being *Very Aware* (40), *Moderately Aware* (31), and *Slightly Aware* (37). This trend highlights the role of higher education in fostering a deeper understanding of insurance policies and their benefits.

Graduation level respondents also demonstrate a solid level of awareness across all categories, with notable numbers in the *Extremely Aware* (53) and *Very Aware* (36) columns.

The Other category shows comparatively low levels of awareness across all categories, suggesting a potential area for targeted financial literacy efforts.

In summary, higher educational attainment is positively associated with increased awareness of insurance policies, underscoring the link between formal education and financial literacy.

Figure 35: Education-wise Awareness on Insurance Policies

Figure 35 illustrates the distribution of awareness levels about insurance policies across different education levels. Post Graduates show the highest Extremely Aware count (141), highlighting their greater understanding and engagement with insurance policies. Meanwhile, Graduation holders have a balanced spread across the awareness levels, indicating a moderate overall awareness. The Other category shows relatively low numbers across all levels, suggesting a potential area for increased financial literacy efforts. In general, higher education appears correlated with higher awareness of insurance policies.

Table 2.38 - Education wise Awareness on Small Savings Schemes

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Graduation	49	38	27	19	12	145
Post Graduation	135	64	39	19	18	275
Other	5	6	6	7	6	30
Grand Total	189	108	72	45	36	450

Source: Primary Data

Table 2.38 illustrates the distribution of awareness levels about Small Savings Schemes across different educational qualifications.

The results reveal a clear trend: Post Graduates have the highest levels of awareness, with 135 respondents being *Extremely Aware* and 64 being *Very Aware*. The category also shows notable counts in *Moderately Aware* (39), making it the dominant group in understanding these schemes.

Meanwhile, Graduation-level respondents also exhibit a strong awareness, with 49 identifying as *Extremely Aware* and 38 as *Very Aware*.

In contrast, those in the Other category have relatively lower awareness across all levels, suggesting a potential area for targeted education and outreach.

Overall, higher education appears to be associated with greater awareness of small savings schemes, reinforcing the role of education in promoting financial literacy and prudent investment habits.

Figure 36: Education-wise Awareness on Small Savings Schemes

Figure 36 highlights how awareness of Small Savings Schemes varies across different education levels. Post Graduates dominate in the *Extremely Aware* category, with 135 respondents, followed by Graduation holders with 49. The trend is consistent across all awareness levels, indicating a strong link between higher education and better understanding of small savings schemes. Meanwhile, the Other category shows relatively low numbers across all levels, suggesting a knowledge gap that could be addressed through targeted awareness programs.

Awareness of respondents towards savings and investment alternatives based on Experience

Table 2.39 - Experience wise Awareness on Bank Deposits

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	4	6	6	8	8	32
5-10	26	14	19	28	11	98
11-15	23	19	16	7	5	70
16-20	38	21	14	8	4	85
More than 20 years	98	30	17	12	8	165
Grand Total	189	90	72	63	36	450

Source: Primary Data

Table 2.39 illustrates the awareness levels about Bank Deposits across different experience brackets.

The data suggests a strong correlation between experience and awareness. Individuals with More than 20 years of experience have the highest levels of awareness, with 98 respondents being *Extremely Aware*, followed by 30 being *Very Aware*.

Similarly, those in the 16–20 years range also demonstrate significant awareness levels, with 38 classified as *Extremely Aware* and 21 as *Very Aware*. Meanwhile, awareness is relatively moderate among those with 5–10 years and 11–15 years of experience.

In contrast, the Less than 5 years category shows lower awareness across the levels, indicating a potential area for targeted financial literacy efforts.

Overall, the trend clearly signifies that longer work experience is associated with higher awareness of Bank Deposit options, underscoring the role of experience and financial exposure in shaping financial knowledge.

Figure 37: Experience-wise Awareness on Bank Deposits

Figure 37 illustrates how experience influences awareness about bank deposit options. Individuals with more than 20 years of experience have the highest level of extremely aware respondents (98), highlighting that long tenures in the workforce build stronger financial knowledge. Meanwhile, those with less than 5 years of experience have relatively low awareness across all categories, indicating a significant area for targeted financial literacy interventions. The trend clearly emphasizes the role that experience and time play in shaping awareness about bank deposit products.

Table 2.40 - Experience wise Awareness on Mutual Funds

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	3	4	5	8	12	32
5-10	16	10	28	16	28	98
11-15	24	16	16	6	8	70
16-20	28	16	25	6	10	85
More than 20 years	55	44	39	9	18	165
Grand Total	126	90	113	45	76	450

Source: Primary Data

Table 2.40 captures the awareness levels of Mutual Fund investments across different experience brackets.

The results highlight that higher experience tends to be associated with greater awareness. Individuals with More than 20 years of experience stand out, with 55 responding as *Extremely Aware* and 44 as *Very Aware*. Similarly, the 16–20 years bracket shows strong awareness, with 28 *Extremely Aware* and 16 *Very Aware*.

Meanwhile, respondents with 5–10 years and 11–15 years of experience have moderate to low levels of awareness, and those with Less than 5 years of experience generally show the lowest levels across the category, indicating room for targeted financial literacy and investment awareness campaigns.

Overall, the trend confirms that experience and exposure play a significant role in shaping familiarity and understanding of Mutual Fund investments.

Figure 38: Experience-wise Awareness on Mutual Funds

Figure 38 shows the awareness levels across different experience ranges for mutual fund investments. Respondents with more than 20 years of experience have the highest proportion of those being extremely aware (55), indicating their deep understanding of mutual fund options. Meanwhile, those with less than 5 years of experience tend to have lower awareness, with higher counts in the slightly aware and not at all aware categories. The trend clearly suggests that increased experience and longer tenures are associated with a higher awareness and understanding of mutual fund products.

Table 2.41 - Experience wise Awareness on Stocks and Shares

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	2	6	8	9	7	32
5-10	8	24	18	26	22	98
11-15	12	21	11	12	14	70
16-20	10	9	28	16	22	85
More than 20 years	40	34	34	27	30	165
Grand Total	72	94	99	90	95	450

Source: Primary Data

Table 2.41 presents the awareness levels of Stocks and Shares across different experience groups.

The data clearly suggests that experience influences awareness: respondents with More than 20 years of experience dominate the category, with 40 indicating they are *Extremely Aware*, and 34 expressing themselves as *Very Aware* and *Moderately Aware*.

Meanwhile, those in the 5–10 years bracket show a relatively balanced trend, with notable proportions across the awareness levels. The 11–15 years and 16–20 years groups display moderate levels of awareness, though with higher counts leaning towards the *Moderately Aware* and *Slightly Aware* ranges.

In contrast, participants with less than 5 years of experience have the lowest awareness across all levels, implying an area where targeted financial literacy and investment training could be beneficial.

Overall, the results emphasize that deeper experience in the workforce tends to correlate with higher awareness of stocks and shares.

Figure 39: Experience-wise Awareness on Stocks and Shares

Figure 39 illustrates the trend in awareness about Stocks and Shares across experience ranges. The trend shows that individuals with more than 20 years of experience have the highest levels of awareness, with significant counts in the extremely aware (40) and very aware (34) categories. Meanwhile, those with less than 5 years of experience have relatively low levels of awareness, with higher counts in the slightly aware and not at all aware ranges. The data suggests a strong link between increased experience and greater understanding of stock and share investment options.

Table 2.42 - Experience wise Awareness on Real Estate

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	4	6	8	7	7	32
5-10	48	22	16	8	4	98
11-15	29	19	12	4	6	70
16-20	36	19	19	7	4	85
More than 20 years	59	51	39	10	6	165
Grand Total	176	117	94	36	27	450

Source: Primary Data

Table 2.42 illustrates the Awareness of Real Estate across different experience levels.

The results reveal a strong trend where higher work experience correlates with greater awareness. Individuals with More than 20 years of experience dominate the category, with 59 indicating that they are *Extremely Aware* and 51 stating they are *Very Aware*.

The 5–10 years experience group also shows a significant level of awareness, with 48 *Extremely Aware* and 22 *Very Aware*. Meanwhile, the 11–15 and 16–20 year experience brackets have moderately balanced responses across the first three awareness levels.

At the lower end, respondents with less than 5 years of experience have the lowest awareness across all levels, suggesting an area for targeted education and financial literacy efforts.

In summary, experience appears to play a pivotal role in shaping awareness of real estate, with senior professionals exhibiting higher knowledge and understanding of this investment avenue.

Figure 40: Experience-wise Awareness on Real Estate

Figure 40 illustrates the trend of awareness about Real Estate across varying experience ranges. As experience increases, the proportion of respondents with higher levels of awareness (extremely aware and very aware) grows significantly. Those with more than 20 years of experience dominate in both these categories (59 and 51 respectively), suggesting a strong link between experience and awareness about real estate. Meanwhile, respondents with less than 5 years of experience have relatively low counts across all awareness levels, indicating that exposure and understanding of this investment option tend to build with professional experience.

Table 2.43- Experience wise Awareness on Gold

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	3	8	10	5	6	32
5-10	12	16	28	19	23	98
11-15	14	13	23	12	8	70
16-20	27	16	14	18	10	85
More than 20 years	34	55	46	14	16	165
Grand Total	90	108	121	68	63	450

Source: Primary Data

Table 2.43 presents the Awareness of Gold across different experience levels.

The results reveal a strong trend wherein higher experience is associated with higher levels of awareness about gold as an investment option. The group with More than 20 years of experience showcases the highest awareness, with 34 respondents being *Extremely Aware*, 55 *Very Aware*, and 46 *Moderately Aware*.

Similarly, those in the 16–20 years bracket also exhibit a significant understanding, with 27 *Extremely Aware* and 16 *Very Aware*. In contrast, respondents with less than 5 years of experience have relatively low awareness across all levels, suggesting that experience in the workforce influences the inclination towards and knowledge about gold as an investment option.

This trend highlights the role experience plays in financial literacy and the tendency for seasoned professionals to be more aware of traditional investment avenues like gold.

Figure 41: Experience-wise Awareness on Gold

Figure 41 displays how awareness of gold as an investment option evolves with work experience. Respondents with more than 20 years of experience dominate across higher awareness levels, with 34 being extremely aware, 55 very aware, and 46 moderately aware. Those with 5–10 years of experience show strong moderate awareness (28) but also notable counts for slight and low awareness (19 and 23, respectively). Conversely, respondents with less than 5 years of experience have lower overall counts across all awareness levels, highlighting how experience and exposure significantly contribute to knowledge about gold as an investment option.

Table 2.44 - Experience wise Awareness on Government Schemes

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	5	8	7	5	7	32
5-10	26	29	16	17	10	98
11-15	25	23	9	8	5	70
16-20	26	19	22	9	9	85
More than 20 years	71	33	27	15	19	165
Grand Total	153	112	81	54	50	450

Source: Primary Data

Table 2.44 displays the Awareness of Government Schemes across different experience levels.

The data clearly highlights a strong correlation between experience and awareness. The category with More than 20 years of experience stands out, with 71 respondents being *Extremely Aware*, followed by 33 *Very Aware*, indicating higher knowledge and understanding of government schemes.

Meanwhile, those with less than 5 years of experience have relatively low levels of awareness across all categories, with only 5 *Extremely Aware* and 8 *Very Aware*. Similar patterns can be observed across the other experience levels, suggesting that longer exposure in the workforce increases familiarity with such schemes.

This trend underscores the role experience plays in shaping financial literacy, especially in understanding and utilizing benefits offered by government schemes.

Figure 42: Experience-wise Awareness on Government Schemes

Figure 42 illustrates how awareness of government schemes varies with work experience. Respondents with more than 20 years of experience dominate across all awareness levels, with 71 being extremely aware and a notable number (33) being very aware. Meanwhile, those with 5–10 years and 11–15 years of experience have moderate to very high awareness, suggesting that early and mid-career professionals have significant exposure to such schemes. The trend clearly shows that as experience grows, so does the understanding and awareness of government schemes, making experience a strong determinant of knowledge about such policies.

Table 2.45 - Experience wise Awareness on Bonds and Debentures

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	4	6	8	6	8	32
5-10	10	35	36	8	9	98
11-15	6	11	26	18	9	70
16-20	26	28	19	6	6	85
More than 20 years	35	28	73	16	13	165
Grand Total	81	108	162	54	45	450

Source: Primary Data

Table 2.45 showcases the Awareness of Bonds and Debentures across different experience levels.

The data clearly indicates that awareness of these financial instruments tends to increase with experience. Individuals with More than 20 years of experience demonstrate the highest awareness, with 35 respondents being *Extremely Aware*, and 28 being *Very Aware*. Similarly, those in the 16–20 years bracket also show notable awareness, with 26 and 28 respondents being *Extremely Aware* and *Very Aware*, respectively.

Meanwhile, those with less than 5 years of experience have relatively low levels of awareness across all categories, suggesting that exposure and experience play significant roles in understanding financial instruments such as bonds and debentures.

Overall, the trend highlights the importance of experience in shaping financial literacy, especially in sophisticated investment areas like bonds and debentures.

Figure 43: Experience-wise Awareness on Bonds and Debentures

Figure 43 showcases the trend of awareness across different experience levels for Bonds and Debentures. Notably, respondents with more than 20 years of experience display the highest level of awareness, especially in the moderately aware category (73), indicating that long tenures in the workforce are associated with deeper understanding. Meanwhile, those with 5–10 years of experience also show significant engagement across all levels, highlighting a trend where mid-career professionals are relatively well-versed in such investment instruments. In contrast, those with less than 5 years of experience generally have lower awareness, suggesting a potential area for targeted financial literacy interventions.

Table 2.46 - Experience wise Awareness on Insurance Policies

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	6	8	10	5	3	32
5-10	36	28	18	10	6	98
11-15	26	18	14	8	4	70
16-20	29	18	6	16	16	85
More than 20 years	101	9	10	24	21	165
Grand Total	198	81	58	63	50	450

Source: Primary Data

Table 2.46 presents the Awareness of Insurance Policies across varying experience levels.

The trend clearly shows that longer experience is associated with higher levels of awareness. Individuals with More than 20 years of experience stand out, with 101 respondents being *Extremely Aware*. Similarly, those in the 5–10 years bracket also display significant awareness, with 36 respondents being *Extremely Aware* and 28 respondents being *Very Aware*.

Meanwhile, respondents with less than 5 years of experience tend to have relatively lower awareness, although a portion of this group shows some interest with a combined total of 24 respondents across the *Extremely Aware* and *Very Aware* categories.

In summary, experience appears to play a pivotal role in shaping awareness about insurance policies, suggesting that longer exposure in a working environment encourages more knowledge and understanding of such financial products.

Figure 44: Experience-wise Awareness on Insurance Policies

Figure 44 illustrates how awareness of Insurance Policies evolves with work experience. Respondents with more than 20 years of experience dominate the “Extremely Aware” category, suggesting a strong understanding built over a long career. Meanwhile, those with 5–10 years and 11–15 years of experience maintain a balanced distribution across awareness levels, indicating moderate knowledge. Interestingly, participants with 16–20 years of experience show noticeable variations across the “Extremely Aware” and “Not at All Aware” categories, highlighting diversity in perceptions within this group. These insights emphasize the role of experience in shaping insurance literacy and the potential benefits of tailored financial education across career stages.

Table 2.47 - Experience wise Awareness on Small Savings Schemes

Income	Extremely aware	Very aware	Moderately aware	Slightly aware	Not at all aware	Total
Less than 5 years	3	6	8	9	6	32
5-10	32	26	24	8	8	98
11-15	26	19	14	6	5	70
16-20	32	27	10	8	8	85
More than 20 years	96	30	16	14	9	165
Grand Total	189	108	72	45	36	450

Source: Primary Data

Table 2.47 presents the distribution of awareness about Small Savings Schemes across different experience levels.

The results highlight a strong trend: respondents with More than 20 years of experience have the highest level of awareness, with 96 indicating that they are *Extremely Aware*, followed by 30 stating that they are *Very Aware*. Meanwhile, the 5–10 years experience group also shows considerable awareness, with 32 being *Extremely Aware* and 26 being *Very Aware*.

In contrast, those with less than 5 years of experience demonstrate relatively lower levels of awareness, although a noticeable number (9) still state that they are *Slightly Aware*.

In summary, the table confirms that longer working experience tends to be associated with higher awareness of Small Savings Schemes, suggesting experience as an influential factor in financial literacy and familiarity.

Figure 45: Experience-wise Awareness on Small Savings Schemes

Figure 45 shows that experience has a notable influence on awareness about Small Savings Schemes. Individuals with more than 20 years of experience dominate the “Extremely Aware” category, highlighting how long exposure and financial literacy evolve together. The 5–10 and 16–20 years experience groups also demonstrate relatively higher levels of awareness across categories compared to early-career individuals, suggesting a trend where practical exposure improves understanding. Meanwhile, those with less than 5 years and 11–15 years experience display more modest levels of awareness, indicating an area where targeted education and financial literacy efforts could have significant benefits.

Table 2.48 - Familiarity with Asset Allocation, Online Trading, Tax Benefits, Compounding Interest and Diversification in Investment of Respondents

Familiarity with	Yes	No	Total
Asset Allocation	50.8%	49.2%	100%
Online Trading	38.2%	61.8%	100%
Tax Benefits	75.8%	24.2%	100%
Compounding Interest and its Impact	64.1%	35.9%	100%
Diversification in Investment	50%	50%	100%

Source: Primary Data

Analysis of the Table 2.48: The data clearly illustrates varying levels of financial literacy among the respondents. The highest level of familiarity is observed with *Tax Benefits*, with roughly three-quarters of respondents (75.8%) indicating that they are aware of this concept. Similarly, a strong understanding is seen for *Compounding Interest and its Impact*, with 64.1% of the sample expressing familiarity.

On the other hand, knowledge about *Online Trading* appears to be relatively low, as only 38.2% of respondents are familiar, indicating a significant knowledge gap (61.8%). Meanwhile, *Asset Allocation* and *Diversification in Investment* have an almost balanced distribution of awareness, with roughly half of the respondents being familiar and the other half not.

In summary, while basic concepts like tax benefits and compounding interest are well understood by the majority, more advanced or practical areas such as online trading and diversified investment strategies still require increased financial literacy efforts.

Table 2.49- Factors which Influence the Awareness of Respondents towards Savings and Investment

Source of Data	No. of Respondents	Percentage
Colleagues or friends	169	37.56%
Family members or relatives	144	32.00%
Financial Advisor	32	7.11%
Online platforms or communities	18	4.00%
Workshops or seminars	14	3.11%
Self-Study/Research	73	16.22%
Total	450	100%

Source: Primary Data

Analysis of the Table 2.49: The data clearly reflects that the majority of respondents gain awareness about savings and investments through interpersonal connections. The largest source is *colleagues or friends*, accounting for 37.56% of the total, followed closely by *family members or relatives* at 32.00%. Together, these two sources comprise nearly 70% of all influences, highlighting the dominant role of social circles.

More formal or structured sources, such as *financial advisors* (7.11%), *online platforms or communities* (4.00%), and *workshops or seminars* (3.11%), have a relatively low impact. Meanwhile, *self-study or research* emerges as an important individual source, making up 16.22% of the total, suggesting a significant segment of respondents relying on personal initiative for financial knowledge.

Overall, the findings underline the strong role of trusted personal connections in shaping financial awareness, with lesser but notable contributions from self-learning and formal guidance.

Figure - Sources Influencing Awareness of Respondents towards Savings and Investment

The pie chart shows that the majority of respondents gain awareness about savings and investment from their *colleagues or friends* (37.56%) and *family members or relatives* (32.00%), making these the most significant influences. Meanwhile, more formal sources such as *financial advisors*, *online platforms*, and *workshops or seminars* have a relatively smaller impact, together accounting for roughly 14%. Notably, *self-study or research* also plays an important role (16.22%), highlighting the growing trend of individuals seeking financial knowledge on their own.

Table 2.50- Awareness of Risks Associated with Different Investment Options

Level of Awareness	Percentage
Very well informed	15.6%
Somewhat informed	63.1%
Neutral	18.0%
Not very informed	9.4%
Not informed at all	3.9%
Total	100%

Source: Primary Data

The data indicates that the majority of respondents have some level of awareness about the risks associated with different investment options. A significant proportion (63.1%) consider themselves *somewhat informed*, while only 15.6% feel *very well informed*. Meanwhile, 18.0% remain *neutral*, and a combined 13.3% (9.4% + 3.9%) admit to being *not very informed* or *not informed at all*. This suggests a generally moderate understanding of investment risks, with room for improved education and awareness efforts.

Table 2.51 - Awareness on Market Sentiments

Level of Awareness	Percentage
Known	37.3%
Somewhat Known	45.1%
Unknown	17.6%
Total	100%

Source: Primary Data

The results indicate that a significant proportion of respondents have some level of awareness about market sentiments, with 37.3% being fully aware and 45.1% being somewhat aware. In contrast, only 17.6% of the respondents remain completely unaware. This suggests that while the majority have a basic understanding of market sentiment, a smaller segment may benefit from further financial education and engagement.
